1.2 About this manual

**Objective and contents**
The manual describes the power supply (PS) that can be used in the VIPA System MICRO. Described are construction, application and technical data.

<table>
<thead>
<tr>
<th>Product</th>
<th>Order no.</th>
<th>as of HW state:</th>
</tr>
</thead>
<tbody>
<tr>
<td>PS M07 DC24V, 1.5A AC120V-240V</td>
<td>M07-2BA00</td>
<td>01</td>
</tr>
</tbody>
</table>

**Target audience**
The manual is targeted at users who have a background in automation technology.

**Structure of the manual**
The manual consists of chapters. Every chapter provides a self-contained description of a specific topic.

**Guide to the document**
The following guides are available in the manual:
- An overall table of contents at the beginning of the manual
- References with page numbers

**Availability**
The manual is available in:
- printed form, on paper
- in electronic form as PDF-file (Adobe Acrobat Reader)

**Icons Headings**
Important passages in the text are highlighted by following icons and headings:

- **DANGER!**
  Immediate or likely danger. Personal injury is possible.

- **CAUTION!**
  Damages to property is likely if these warnings are not heeded.

- **Supplementary information and useful tips.**
1.3 Safety instructions

**Warning symbol on the housing**

DANGER!
There is a warning symbol on the housing of the power supply. This indicates that all safety instructions listed in this manual must be observed before commissioning!

**Intended use**

DANGER!
Failure to comply with the specification may affect the protective functions of the system!

The power supply is constructed and produced for:

- the DC 24V supply of components.
- operation within the environmental conditions specified in the technical data
- the installation on a 35mm mounting rail in a control cabinet, which provides protection against fire, environmental influences and mechanical impact
- industrial applications

DANGER!
This device is not certified for applications in
- in explosive environments (EX-zone)

**Documentation**

The manual must be available to all personnel in the

- project design department
- installation department
- commissioning
- operation

CAUTION!
The following conditions must be met before using or commissioning the components described in this manual:

- Hardware modifications should only be carried out when the system has been disconnected from power!
- Installation and hardware modifications only by properly trained personnel.
- The national rules and regulations of the respective country must be satisfied (installation, safety, EMC ...)

**Disposal**

National rules and regulations apply to the disposal of the unit!
2 Basics and mounting

2.1 Safety information for users

**Handling of electrostatic sensitive modules**

VIPA modules make use of highly integrated components in MOS-Technology. These components are extremely sensitive to over-voltages that can occur during electrostatic discharges. The following symbol is attached to modules that can be destroyed by electrostatic discharges.

![Symbol]

The Symbol is located on the module, the module rack or on packing material and it indicates the presence of electrostatic sensitive equipment. It is possible that electrostatic sensitive equipment is destroyed by energies and voltages that are far less than the human threshold of perception. These voltages can occur where persons do not discharge themselves before handling electrostatic sensitive modules and they can damage components thereby, causing the module to become inoperable or unusable. Modules that have been damaged by electrostatic discharges can fail after a temperature change, mechanical shock or changes in the electrical load. Only the consequent implementation of protection devices and meticulous attention to the applicable rules and regulations for handling the respective equipment can prevent failures of electrostatic sensitive modules.

**Shipping of modules**

Modules must be shipped in the original packing material.

**Measurements and alterations on electrostatic sensitive modules**

When you are conducting measurements on electrostatic sensitive modules you should take the following precautions:

- Floating instruments must be discharged before use.
- Instruments must be grounded.

Modifying electrostatic sensitive modules you should only use soldering irons with grounded tips.

---

**CAUTION!**

Personnel and instruments should be grounded when working on electrostatic sensitive modules.
2.2 System conception

Overview

The System MICRO is a modular automation system for assembly on a 35mm mounting rail. By means of periphery modules this system may be adapted matching to your automation tasks. In addition, it is possible to expand your CPU by appropriate interfaces. The wiring complexity is low, because the DC 24V electronic section supply is integrated to the backplane bus and this allows replacement with standing wire.

Components

- CPU
- Extension module
- Periphery module

CPU

With the CPU electronic, input/output components and power supply are integrated to one casing. In addition, up to 8 periphery modules of the System MICRO can be connected to the backplane bus. As head module via the integrated power module for power supply CPU electronic and the I/O components are supplied as well as the electronic of the periphery modules, which are connected via backplane bus. To connect the power supply of the I/O components and for DC 24V electronic power supply of the periphery modules, which are connected via backplane bus, the CPU has removable connectors. By installing of up to 8 periphery modules at the backplane bus of the CPU, these are electrically connected, this means these are assigned to the backplane bus and connected to the DC 24V electronic power supply.

Extension module

By using extension modules you can extend the interfaces of the CPU. The attachment to the CPU is made by plugging on the left side of the CPU. You can only connect one extension module to the CPU at a time.
The power supply is mounted on the left side from the DIN rail with the System MICRO modules. It serves for electronics and power supply.

By means of up to 8 periphery modules, you can extend the internal I/O areas. The attachment to the CPU is made by plugging them on the right side of the CPU.

2.3 Dimensions

Dimensions CPU M13C

Dimensions in mm
Dimensions extension module EM M09

Dimensions in mm

Dimensions power supply
2.4 Mounting

**Observe minimum distance!**
For operation within the specified nominal values, they must comply with a minimum distance of 30 mm on one side of the module!
2.4.1 Mounting without mounting rail

**Proceeding**

You can screw the power supply to the back wall by means of screws via the locking levers. The happens with the following proceeding:

1. The power supply has a locking lever on the upper and lower side. Pull these levers outwards as shown in the figure, until these engage 2x audible.
   ⇒ By this openings on the locking levers get visible.

2. Use this openings to fix your power supply to your back wall with appropriate screws. Consider the installation clearances for the power supply.
   ⇒ The power supply is now mounted and can be wired.

### Dimensions in mm

1. Mount the mounting rail. Please consider that a clearance from the middle of the mounting rail of at least 44mm respectively 55mm above and below exists.

---

HB400 | PS | M07-2BA00 | en | 20-02                 
13
2. The power supply has a locking lever on the upper and lower side. Pull these levers outwards as shown in the figure, until these engage audible.

**CAUTION!**
It is not allowed to mount the module sideways on the mounting rail, as otherwise the module may be damaged.

3. Plug the power supply from the top onto the mounting rail and turn the power supply downward until it rests on the mounting rail.

4. Move the power supply on the mounting rail at its position.

5. To fix the power supply at the mounting rail, move the locking levers back to the initial position.
   ⇒ The power supply is now mounted and can be wired.
2.5 Wiring

DANGER!
Consider strain relief of the supply lines!
Since the plug for the supply lines of the input voltage has no (double) insulation, not permanently fixed supply lines must be relieved from push and pull!

CAUTION!
Consider temperature for external cables!
Cables may experience temperature increase due to system heat dissipation. Thus the cabling specification must be chosen 25°C above ambient temperature!

CAUTION!
Separate insulation areas!
The system is specified for SELV/PELV environment. Devices, which are attached to the system must meet these specifications. Installation and cable routing other than SELV/PELV specification must be separated from the system’s equipment!

2.5.1 Wiring power supply

Connectors
For wiring the power supply has removable connectors. With the wiring of the connectors a "push-in" spring-clip technique is used. This allows a quick and easy connection of your supply lines. The clamping off takes place by means of a screwdriver.

Data

\[
\begin{align*}
U_{\text{max}} & : 240\text{V AC} / 30\text{V DC} \\
I_{\text{max}} & : 2\text{A} \\
\text{Cross section} & : 0.2 \ldots 1.5\text{mm}^2 \text{ (AWG 24 \ldots 16)} \\
\text{Stripping length} & : 10\text{mm}
\end{align*}
\]

Use for wiring rigid wires respectively use wire sleeves. When using stranded wires you have to press the release button with a screwdriver during the wiring.

Wiring procedure

1. Labeling on the casing
2. Release area
3. Connection hole for wire
4. Pin 1 of the connector is labelled by a white line.
Insert wire

The wiring happens without a tool.

Determine according to the casing labelling the connection position and insert through the round connection hole of the according contact your prepared wire until it stops, so that it is fixed.

By pushing the contact spring opens, thus ensuring the necessary contact pressure.

Remove wire

The wire is to be removed by means of a screwdriver with 2.5mm blade width.

1. Press with your screwdriver vertically at the release button.
   - The contact spring releases the wire.

2. Pull the wire from the round hole.

Fusing

CAUTION!
To protect the power supply lines, you should use a circuit breaker with the following characteristics:

- Rated current at AC 230V: 4A
- Tripping characteristic: C

2.6 Demounting

Remove connector

By means of a screwdriver there is the possibility to remove the connectors e.g. for module exchange with a fix wiring. For this each connector has indentations for unlocking at the top. Unlocking takes place by the following proceeding:

1. Remove connector:
   - Insert your screwdriver from above into one of the indentations.
2. Push the screwdriver backwards:
   ⇒ The connector is unlocked and can be removed.

   **CAUTION!**
   Via wrong operation such as pressing the screwdriver downward, the release lever may be damaged.

3. In this way, remove all plugged connectors on the power supply.

---

**Power supply replacement**

**Replacement on mounting rail**

The replacement of the power supply on the mounting rail happens with the following proceeding:

1. Use a screwdriver to pull the locking levers of the power supply outwards until these engage audible.

2. Remove the power supply with a rotation upwards from the mounting rail.

3. Pull the locking levers of the new power supply outwards until these engage audible. Plug the power supply from the top onto the mounting rail and turn the power supply downward until it rests on the mounting rail.

   **CAUTION!**
   It is not allowed to mount the module sideways on the mounting rail, as otherwise the module may be damaged!
Basics and mounting

Demounting

4. Move the power supply on the mounting rail at its position.

5. To fix the power supply at the mounting rail, move the locking levers back to the initial position.

⇒ The power supply is now mounted and can be wired.

Plug connector

1. Remove the connectors, which are not necessary at the power supply.

2. Plug again the wired connectors.

⇒ Now you can bring your system back into operation.
2.7 Installation guidelines

General

The installation guidelines contain information about the interference free deployment of a PLC system. There is the description of the ways, interference may occur in your PLC, how you can make sure the electromagnetic compatibility (EMC), and how you manage the isolation.

What does EMC mean?

Electromagnetic compatibility (EMC) means the ability of an electrical device, to function error free in an electromagnetic environment without being interfered respectively without interfering the environment.

The VIPA components are developed for the deployment in industrial environments and meets high demands on the EMC. Nevertheless you should project an EMC planning before installing the components and take conceivable interference causes into account.

Possible interference causes

Electromagnetic interferences may interfere your control via different ways:

- Electromagnetic fields (RF coupling)
- Magnetic fields with power frequency
- Bus system
- Power supply
- Protected earth conductor

Depending on the spreading medium (lead bound or lead free) and the distance to the interference cause, interferences to your control occur by means of different coupling mechanisms.

There are:

- galvanic coupling
- capacitive coupling
- inductive coupling
- radiant coupling

Basic rules for EMC

In the most times it is enough to take care of some elementary rules to guarantee the EMC. Please regard the following basic rules when installing your PLC.

- Take care of a correct area-wide grounding of the inactive metal parts when installing your components.
  - Install a central connection between the ground and the protected earth conductor system.
  - Connect all inactive metal extensive and impedance-low.
  - Please try not to use aluminium parts. Aluminium is easily oxidizing and is therefore less suitable for grounding.

- When cabling, take care of the correct line routing.
  - Organize your cabling in line groups (high voltage, current supply, signal and data lines).
  - Always lay your high voltage lines and signal respectively data lines in separate channels or bundles.
  - Route the signal and data lines as near as possible beside ground areas (e.g. suspension bars, metal rails, tin cabinet).
Proof the correct fixing of the lead isolation.
- Data lines must be laid isolated.
- Analog lines must be laid isolated. When transmitting signals with small amplitudes the one sided laying of the isolation may be favourable.
- Lay the line isolation extensively on an isolation/protected earth conductor rail directly after the cabinet entry and fix the isolation with cable clamps.
- Make sure that the isolation/protected earth conductor rail is connected impedance-low with the cabinet.
- Use metallic or metallised plug cases for isolated data lines.

In special use cases you should appoint special EMC actions.
- Consider to wire all inductivities with erase links.
- Please consider luminescent lamps can influence signal lines.

Create a homogeneous reference potential and ground all electrical operating supplies when possible.
- Please take care for the targeted employment of the grounding actions. The grounding of the PLC serves for protection and functionality activity.
- Connect installation parts and cabinets with your PLC in star topology with the isolation/protected earth conductor system. So you avoid ground loops.
- If there are potential differences between installation parts and cabinets, lay sufficiently dimensioned potential compensation lines.

Electrical, magnetically and electromagnetic interference fields are weakened by means of an isolation, one talks of absorption. Via the isolation rail, that is connected conductive with the rack, interference currents are shunt via cable isolation to the ground. Here you have to make sure, that the connection to the protected earth conductor is impedance-low, because otherwise the interference currents may appear as interference cause.

When isolating cables you have to regard the following:
- If possible, use only cables with isolation tangle.
- The hiding power of the isolation should be higher than 80%.
- Normally you should always lay the isolation of cables on both sides. Only by means of the both-sided connection of the isolation you achieve high quality interference suppression in the higher frequency area. Only as exception you may also lay the isolation one-sided. Then you only achieve the absorption of the lower frequencies. A one-sided isolation connection may be convenient, if:
  - the conduction of a potential compensating line is not possible.
  - analog signals (some mV respectively µA) are transferred.
  - foil isolations (static isolations) are used.
- With data lines always use metallic or metallised plugs for serial couplings. Fix the isolation of the data line at the plug rack. Do not lay the isolation on the PIN 1 of the plug bar!
- At stationary operation it is convenient to strip the insulated cable interruption free and lay it on the isolation/protected earth conductor line.
- To fix the isolation tangles use cable clamps out of metal. The clamps must clasp the isolation extensively and have well contact.
- Lay the isolation on an isolation rail directly after the entry of the cable in the cabinet. Lead the isolation further on to your PLC and don't lay it on there again!

**CAUTION!**
Please regard at installation!
At potential differences between the grounding points, there may be a compensation current via the isolation connected at both sides.
Remedy: Potential compensation line

3 Power supply

3.1 Safety instructions

Mounting

For the power supply applies:

- It is mounted together with your System MICRO modules on a DIN rail. In this case, the power supply must always be mounted only on the outer edge of your System MICRO, otherwise the backplane bus is interrupted. The power supply has no connection to the backplane bus.
- When selecting the mounting location, please note that the power supply is sufficiently cooled during operation.

Below are the precautions to take when using the power supply.

**CAUTION!**

- The power supply may only be installed in dry rooms, which are only accessible by the maintenance engineer!
- The power supply is not approved for use in potentially explosive environments (EX zone)!
- Before you start to work on at the power supply for installation or maintenance, you have to disconnect it from the main power source, i.e. the power line is to be switched off (unplug the plug, with permanent connection the associated fuse must be removed)!
- Only properly qualified electrical staff is allowed to install, connect and/or modify electrical equipment!
- Due to the compact design, the contact and fire protection can not be maintained to ensure sufficient cooling. For this reason, fire protection must be ensured by the construction of the environment of the installed power supply unit (e.g. installation in a control cabinet that complies with the fire protection regulations)!
- Please adhere to the national rules and regulations of the location and/or country where the units are installed (installation, safety precautions, EMC ...).
3.2 PS M07 DC24V, 1.5A_AC120V-240V

Properties

- Output current 1.5A
- Rated output voltage DC 24V
- Connection to single-phase AC mains wide-range input AC 120...240V without manual switching
- Protection against short circuit and overload
- Can be used together with System MICRO on the rail
- Safe electrical isolation according to EN 60950
- Overtemperature protection
- Efficiency typ. 90% at I_{nominal}
- Can be used as electronic and power section supply

To protect the power supply lines, you should use a circuit breaker with the following characteristics:

- Rated current at AC 230V: 4A
- Tripping characteristic: C

So that the circuit breaker can be easily replaced or reset, this should be mounted easily accessible.

The DC 24V output is divided into 2 terminals each. Here you can connect your components, which are to be supplied externally with DC 24V. The DC 24V output is short-circuit proof with an output voltage of DC 24V at a total current of max. 1.5A.

Operation outside the nominal values

In applications according to CE approval, operation outside the nominal values is permissible, but not in applications according to UL approval!

Regarding the following temperature ranges, operation outside the nominal values is possible

<table>
<thead>
<tr>
<th>Output current</th>
<th>1.5A</th>
<th>2A</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input voltage AC</td>
<td>100 ... 119V</td>
<td>100 ... 119V</td>
</tr>
<tr>
<td>Ambient temperature (horizontal installation)</td>
<td>0 ... 55°C</td>
<td>0 ... 35°C</td>
</tr>
<tr>
<td>Ambient temperature (vertical installation)</td>
<td>0 ... 50°C</td>
<td>0 ... 30°C</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output current</th>
<th>1.5A</th>
<th>2A</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input voltage DC</td>
<td>110 ... 119V</td>
<td>110 ... 119V</td>
</tr>
<tr>
<td>Ambient temperature (horizontal installation)</td>
<td>0 ... 55°C</td>
<td>0 ... 35°C</td>
</tr>
<tr>
<td>Ambient temperature (vertical installation)</td>
<td>0 ... 50°C</td>
<td>0 ... 30°C</td>
</tr>
</tbody>
</table>
