# **1.2 About this manual**

**Objective and contents** 

# This manual describes the CPU 013-CCF0R00 of the System SLIO.

- It describes the structure, configuration and application.
- The manual is written for users with basic knowledge of automation technology.
- The manual consists of chapters. Each chapter describes a completed topic.
- The following guides are available in the manual:
  - An overall table of contents at the beginning of the manual.
  - References with pages numbers.

# Validity of the documentation

Product	Order number	as of version:	
CPU 013C	013-CCF0R00	CPU-HW: 01	CPU-FW: V3.0.9

**Icons Headings** 

Important passages in the text are highlighted by following icons and headings:

**DANGER!** Immediate or likely danger. Personal injury is possible.

CAUTION!

Damages to property is likely if these warnings are not heeded.

Supplementary information and useful tips.

# 1.3 Safety information

Applications conforming with specifications

- The system is constructed and produced for:
- communication and process control
- general control and automation tasks
- industrial applications
- operation within the environmental conditions specified in the technical data
- installation into a cubicle

This device is not certified for applications in in explosive environments (EX-zone)

**Documentation** 

The manual must be available to all personnel in the

- project design department
- installation department
- commissioning
- operation

# **CAUTION!**

The following conditions must be met before using or commissioning the components described in this manual:

- Hardware modifications to the process control system should only be \_ carried out when the system has been disconnected from power!
- Installation and hardware modifications only by properly trained personnel.
- The national rules and regulations of the respective country must be satisfied (installation, safety, EMC ...)

Disposal

National rules and regulations apply to the disposal of the unit!

Safety notes for the user

#### **Basics and mounting** 2

# 2.1 Safety notes for the user

#### Protection against dangerous voltages

- When using System SLIO modules, the user must be protected from touching hazardous voltage.
- You must therefore create an insulation concept for your system that includes safe separation of the potential areas of ELV and hazardous voltage.
- Here, observe the insulation voltages between the potential areas specified for the System SLIO modules and take suitable measures, such as using PELV/SELV power supplies for System SLIO modules.

#### Handling of electrostatic sensitive modules

The modules are equipped with highly integrated components in MOS technology. These components are highly sensitive to over-voltages that occur, e.g. with electrostatic discharge. The following symbol is used to identify these hazardous modules:

The symbol is located on modules, module racks or on packaging and thus indicates electrostatic sensitive modules. Electrostatic sensitive modules can be destroyed by energies and voltages that are far below the limits of human perception. If a person who is not electrically discharged handles electrostatic sensitive modules, voltages can occur and damage components and thus impair the functionality of the modules or render the modules unusable. Modules damaged in this way are in most cases not immediately recognized as faulty. The error can only appear after a long period of operation. Components damaged by static discharge can show temporary faults when exposed to temperature changes, vibrations or load changes. Only the consistent use of protective devices and responsible observance of the handling rules can effectively prevent malfunctions and failures on electrostatic sensitive modules.

Shipping of modules

Please always use the original packaging for shipping.

Measurement and modification of electrostatic sensitive modules

For measurements on electrostatic sensitive modules the following must be observed:

- Floating measuring instruments must be discharged before use.
- Measuring instruments used must be grounded.

When modifying electrostatic sensitive modules, ensure that a grounded soldering iron is used.

#### **CAUTION!**

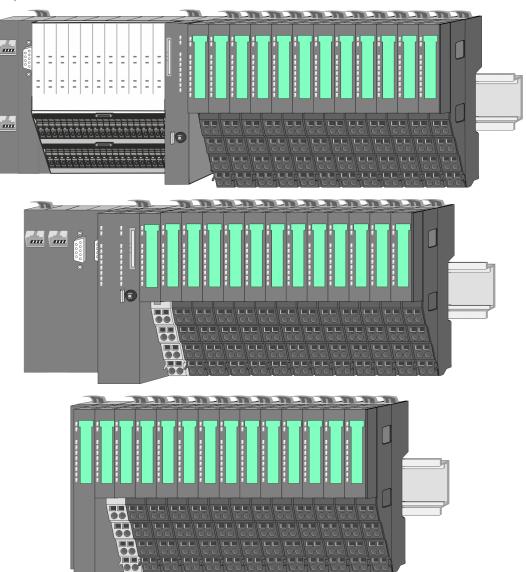

When working with and on electrostatic sensitive modules, make sure that personnel and equipment are adequately grounded.

System conception > Overview

# 2.2 System conception

# 2.2.1 Overview

The System SLIO is a modular automation system for assembly on a 35mm mounting rail. By means of the periphery modules with 2, 4, 8 and 16 channels this system may properly be adapted matching to your automation tasks. The wiring complexity is low, because the supply of the DC 24V power section supply is integrated to the backplane bus and defective modules may be replaced with standing wiring. By deployment of the power modules in contrasting colors within the system, further isolated areas may be defined for the DC 24V power section supply, respectively the electronic power supply may be extended with 2A.

# 2.2.2 Components

- CPU (head module)
- Bus coupler (head module)
- Line extension
- 8x periphery modules
- 16x periphery modules
- Power modules
- Accessories

#### **CAUTION!**

Only Yaskawa modules may be combined. A mixed operation with thirdparty modules is not allowed!

# CPU 01xC

With the CPU 01xC electronic, input/output components and power supply are integrated to one casing. In addition, up to 64 periphery modules of the System SLIO can be connected to the backplane bus. As head module via the integrated power module for power supply CPU electronic and the I/O components are supplied as well as the electronic of the periphery modules, which are connected via backplane bus. To connect the power supply of the I/O components and for DC 24V power section supply of via backplane bus connected periphery modules, the CPU has removable connectors. By installing of up to 64 periphery modules at the backplane bus, these are electrically connected, this means these are assigned to the backplane bus, the electronic modules are power supplied and each periphery module is connected to the DC 24V power section supply.

#### **CPU 01x**

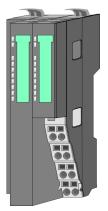

With this CPU 01x, CPU electronic and power supply are integrated to one casing. As head module, via the integrated power module for power supply, CPU electronic and the electronic of the connected periphery modules are supplied. The DC 24V power section supply for the linked periphery modules is established via a further connection of the power module. By installing of up to 64 periphery modules at the backplane bus, these are electrically connected, this means these are assigned to the backplane bus, the electronic modules are power supplied and each periphery module is connected to the DC 24V power section supply.

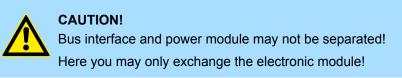

CPU part and power module may not be separated! Here you may only exchange the electronic module!

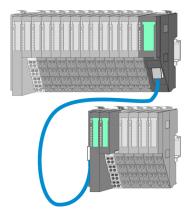

#### **Bus coupler**

With a bus coupler bus interface and power module is integrated to one casing. With the bus interface you get access to a subordinated bus system. As head module, via the integrated power module for power supply, bus interface and the electronic of the connected periphery modules are supplied. The DC 24V power section supply for the linked periphery modules is established via a further connection of the power module. By installing of up to 64 periphery modules at the bus coupler, these are electrically connected, this means these are assigned to the backplane bus, the electronic modules are power supplied and each periphery module is connected to the DC 24V power section supply.

#### Line extension

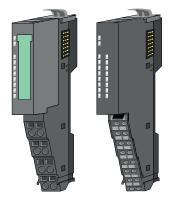

In the System SLIO there is the possibility to place up to 64 modules in on line. By means of the line extension you can divide this line into several lines. Here you have to place a line extension master at each end of a line and the subsequent line has to start with a line extension slave. Master and slave are to be connected via a special connecting cable. In this way, you can divide a line on up to 5 lines. For each line extension the maximum number of pluggable modules at the System SLIO bus is decreased by 1. To use the line extension no special configuration is required.

Please note that some modules do not support line extensions due to the system. For more information, see the 'System SLIO - Compatibility List' at www.yaskawa.eu.com

#### **Periphery modules**

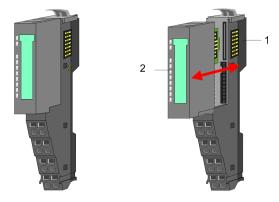

The periphery modules are available in the following 2 versions, whereby of each the electronic part can be replaced with standing wiring:

- 8x periphery module for a maximum of 8 channels.
- 16x periphery module for a maximum of 16 channels.

System conception > Components

#### 8x periphery modules

Each 8x periphery module consists of a terminal and an electronic module.

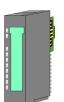

- 1 Terminal module
- 2 Electronic module

# Terminal module

The *terminal* module serves to carry the electronic module, contains the backplane bus with power supply for the electronic, the DC 24V power section supply and the staircase-shaped terminal for wiring. Additionally the terminal module has a locking system for fixing at a mounting rail. By means of this locking system your system may be assembled outside of your switchgear cabinet to be later mounted there as whole system.

# Electronic module

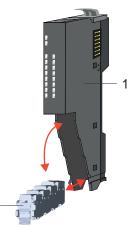

The functionality of a periphery module is defined by the *electronic module*, which is mounted to the terminal module by a sliding mechanism. With an error the defective electronic module may be exchanged for a functional module with standing installation. At the front side there are LEDs for status indication. For simple wiring each module shows corresponding connection information at the front and at the side.

16x periphery modules

Each 16x periphery module consists of an *electronic unit* and a *terminal block*.

- 1 Electronic unit
- 2 Terminal block

System conception > Accessories

# Electronic unit

The functionality of a 16x periphery module is defined via the terminal block, which is connected to the *electronic unit* via a secure flap mechanism. In the case of an error you can exchange the defective electronic unit for a functional unit with standing wiring. At the front side there are LEDs for status indication. For easy wiring each electronic unit shows corresponding connection information at the side. The electronic unit provides the slot for the terminal block for the wiring and contains the backplane bus with power supply for the electronic and the connection to the DC 24V power section supply. Additionally the electronic unit has a locking system for fixing it at a mounting rail. By means of this locking system your system may be assembled outside of your switchgear cabinet to be later mounted there as whole system.

Terminal block

the module. When mounting the terminal block, it is attached to the bottom of the electronic unit and turned towards the electronic unit until it clicks into place. With the wiring a "push-in" spring-clip technique is used. This allows a quick and easy connection of your signal and supply lines. The clamping off takes place by means of a screwdriver.

The terminal block provides the electrical interface for the signalling and supplies lines of

## **Power module**

In the System SLIO the power supply is established by power modules. These are either integrated to the head module or may be installed between the periphery modules. Depending on the power module isolated areas of the DC 24V power section supply may be defined respectively the electronic power supply may be extended with 2A. For better recognition the colour of the power modules are contrasting to the periphery modules.

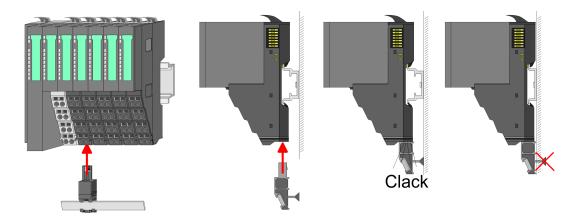

# 2.2.3 Accessories Shield bus carrier

Please note that a shield bus carrier cannot be mounted on a 16x periphery module!

The shield bus carrier (order no.: 000-0AB00) serves to carry the shield bus (10mm x 3mm) to connect cable shields. Shield bus carriers, shield bus and shield fixings are not in the scope of delivery. They are only available as accessories. The shield bus carrier is mounted underneath the terminal of the terminal module. With a flat mounting rail for adaptation to a flat mounting rail you may remove the spacer of the shield bus carrier.

System conception > Accessories

**Bus cover** 

With each head module, to protect the backplane bus connectors, there is a mounted bus cover in the scope of delivery. You have to remove the bus cover of the head module before mounting a System SLIO module. For the protection of the backplane bus connector you always have to mount the bus cover at the last module of your system again. The bus cover has the order no. 000-0AA00.

**Coding pins** 

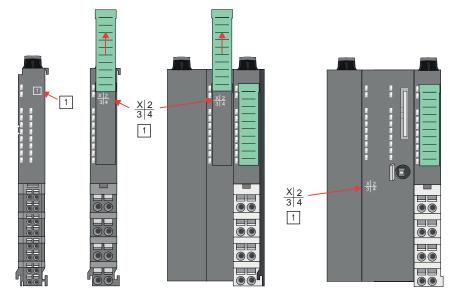

Please note that a coding pin cannot be installed on a 16x periphery module! Here you have to make sure that the associated terminal block is plugged again when the electronics unit is replaced.

There is the possibility to fix the assignment of electronic and terminal module. Here coding pins (order number 000-0AC00) can be used. The coding pin consists of a coding jack and a coding plug. By combining electronic and terminal module with coding pin, the coding jack remains in the electronic module and the coding plug in the terminal module. This ensures that after replacing the electronic module just another electronic module can be plugged with the same encoding.

# 2.2.4 Hardware revision

```
Hardware revision on the front
```

- The hardware revision is printed on every System SLIO module.
- Since a System SLIO 8x periphery module consists of a terminal and electronic module, you will find a hardware revision printed on each of them.
- Authoritative for the hardware revision of a System SLIO module is the hardware revision of the electronic module. This is located under the labeling strip of the corresponding electronic module.
- Depending on the module type, there are the following 2 variants e.g. to indicate hardware revision 1:
  - Current modules have a 1 on the front.
  - With earlier modules, the 1 is marked with X' on a number grid.

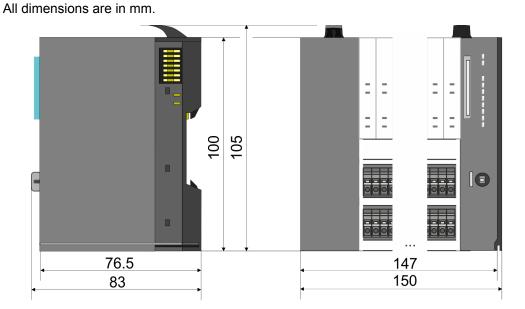

# Hardware revision via web server

On the CPUs and some bus couplers, you can check the hardware revision '*HW Revision*' via the integrated web server.

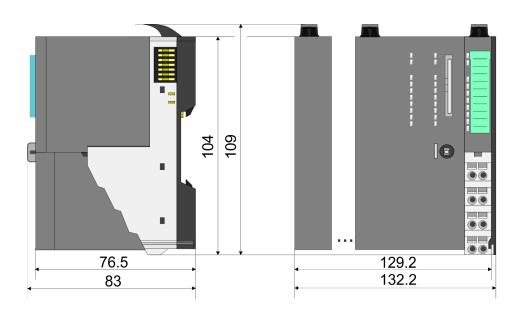

# 2.3 Dimensions

Electronic module

# 16x periphery module

Mounting > Mounting CPU 01xC

# 2.4 Mounting

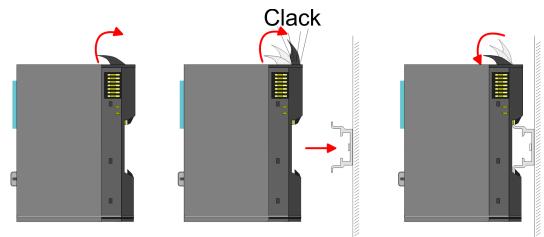

# TION!

Requirements for UL compliance use

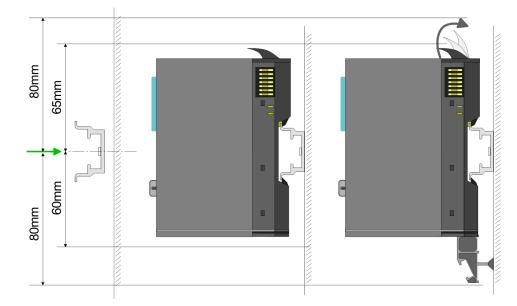

- Use for power supply exclusively SELV/PELV power supplies.
- The System SLIO must be installed and operated in a housing according to IEC 61010-1 9.3.2 c).

# 2.4.1 Mounting CPU 01xC

There are locking lever at the top side of the CPU. For mounting and demounting these locking lever are to be turned upwards until these engage. Place the CPU at the mounting rail. The CPU is fixed to the mounting rail by pushing downward the locking levers. The CPU is directly mounted at a mounting rail. Up to 64 modules may be mounted. The electronic and power section supply are connected via the backplane bus. Please consider here that the sum current of the electronic power supply does not exceed the maximum value of 1A. By means of the power module 007-1AB10 the current of the electronic power supply may be expanded accordingly.

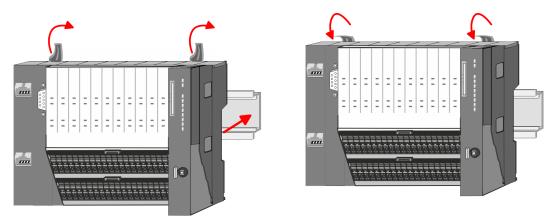

Proceeding

1. Mount the mounting rail! Please consider that a clearance from the middle of the mounting rail of at least 80mm above and 60mm below, respectively 80mm by deployment of shield bus carriers, exist.

# **Basics and mounting**

Mounting > Mounting CPU 01xC

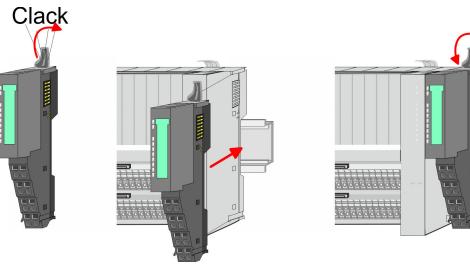

- **2.** Turn the locking lever upwards, place the CPU at the mounting rail and turn the lever downward.
  - ⇒ If you want to use the CPU without periphery modules, the mounting is now complete.

Mounting periphery modules

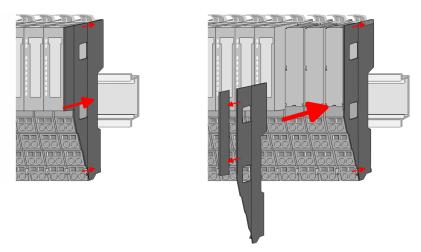

**1.** Before mounting the periphery modules you have to remove the bus cover at the right side of the CPU by pulling it forward. Keep the cover for later mounting.

**2.** Mount the periphery modules you want.

Wiring > Wiring CPU 01xC

**3.** After mounting the whole system, to protect the backplane bus connectors at the last module you have to mount the bus cover, now. If the last module is a clamp module, for adaptation the upper part of the bus cover is to be removed.

# 2.5 Wiring

# CAUTION!

#### **Consider temperature for external cables!**

Cables may experience temperature increase due to system heat dissipation. Thus the cabling specification must be chosen 5°C above ambient temperature!

# CAUTION!

Separate insulation areas!

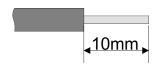

The system is specified for SELV/PELV environment. Devices, which are attached to the system must meet theses specifications. Installation and cable routing other than SELV/PELV specification must be separated from the system's equipment!

# 2.5.1 Wiring CPU 01xC

#### **CPU** connector

For wiring the CPU 01xC has removable connectors. With the wiring of the connectors a "push-in" spring-clip technique is used. This allows a quick and easy connection of your signal and supply lines. The clamping off takes place by means of a screwdriver.

Data

 U<sub>max</sub>
 30V DC

 I<sub>max</sub>
 10A

 Cross section
 0.08 ... 1.5mm² (AWG 28 ... 16)

 Stripping length

Use for wiring rigid wires respectively use wire sleeves. When using stranded wires you have to press the release button with a screwdriver during the wiring.

Wiring > Wiring CPU 01xC

# Wiring procedure

#### **Insert wire**

The wiring happens without a tool.

Labeling on the casing

Release button

Pin no. at the connector

Connection hole for wire

1

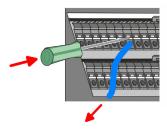

2

3

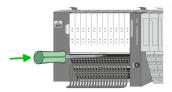

4

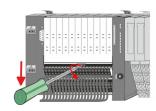

- Determine according to the casing labelling the connection position and insert through the round connection hole of the according contact your prepared wire until it stops, so that it is fixed.
  - By pushing the contact spring opens, thus ensuring the necessary contact pres-⇒ sure.

**Remove wire** 

**Remove connectors** (module replacement)

**2.** Pull the wire from the round hole.

**1.** Press with your screwdriver vertically at the release button.

 $\Rightarrow$  The contact spring releases the wire.

The wire is to be removed by means of a screwdriver with 2.5mm blade width.

By means of a screwdriver there is the possibility to remove the connectors e.g. for module exchange with a fix wiring. For this each connector has a release lever centrally on its top side. Unlocking takes place by the following proceeding:

1. Remove connector:

Push your screwdriver horizontally into the slot between connector and release lever, until it stops.

- **2.** Push the screwdriver down:
  - The connector is unlocked and can be removed by turning downwards. ⇒

# **CAUTION!**

Via wrong operation such as pressing, the screwdriver upward the release lever may be damaged.

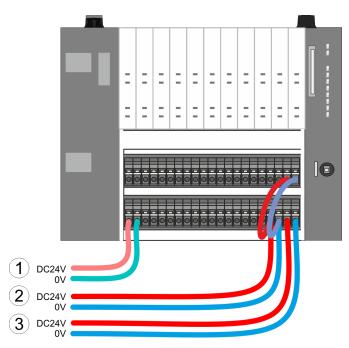

3. Plug connector:

The connector is plugged by setting it at the bottom line and engage with a with a slight twist upwards into the release lever.

## **Basics and mounting**

Wiring > Wiring CPU 01xC

#### Standard wiring

- (1) DC 24V for electronic section supply of the CPU, the internal I/Os and SLIO bus
- (2) DC 24V for power section supply integrated I/Os
- (3) DC 24V for power section supply SLIO bus

The electronic power section supply is internally protected against higher voltage by fuse. The fuse is located inside the CPU and can not be changed by the user.

#### Fusing

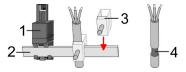

- It is recommended to externally protect the electronic power supply for CPU and SLIO bus with a 3A fuse (fast) respectively by a line circuit breaker 3A characteristics Z.
- The power section supply of the internal I/Os is to be externally protected with a 6A fuse (fast) respectively by a line circuit breaker 6A characteristics Z!
- The power section supply of the SLIO bus is to be externally protected with a 6A fuse (fast) respectively by a line circuit breaker 6A characteristics Z! For UL-compliant operation, use a fuse that is UL listed or "UL-recognized".

After PowerON of the System SLIO the LEDs RUN respectively MF get on so far as the sum current does not exceed 1A. With a sum current greater than 1A the LEDs may not be activated. Here the power module with the order number 007-1AB10 is to be placed between the peripheral modules.

Shield attachment

State of the electronic

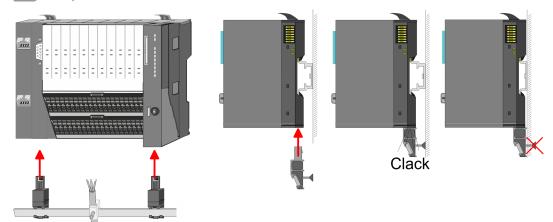

power supply via LEDs

- 1 Shield bus carrier
- 2 Shield bus (10mm x 3mm)
- 3 Shield clamp
- 4 Cable shield

To attach the shield the mounting of shield bus carriers are necessary. The shield bus carrier (available as accessory) serves to carry the shield bus to connect cable shields.

- **1.** Each System SLIO module has a carrier hole for the shield bus carrier. Push the shield bus carrier, until they engage into the module. With a flat mounting rail for adaptation to a flat mounting rail you may remove the spacer of the shield bus carrier.
- 2. Put your shield bus into the shield bus carrier.

**3.** Attach the cables with the accordingly stripped cable screen and fix it by the shield clamp with the shield bus.

# 2.5.2 Wiring 8x periphery modules

# Terminal module terminals

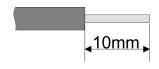

# Do not connect hazardous voltages!

If this is not explicitly stated in the corresponding module description, hazardous voltages are not allowed to be connected to the corresponding terminal module!

With wiring the terminal modules, terminals with spring clamp technology are used for wiring. The spring clamp technology allows quick and easy connection of your signal and supply lines. In contrast to screw terminal connections this type of connection is vibration proof.

I: Input

# CAUTION!

Since the power section supply is not internally protected, it is to be externally protected with a fuse, which corresponds to the maximum current. This means max. 10A is to be protected by a 10A fuse (fast) respectively by a line circuit breaker 10A characteristics *Z*!

The electronic power section supply is internally protected against higher voltage by fuse. The fuse is within the power module. If the fuse releases, its electronic module must be exchanged!

Fusing

- The power section supply is to be externally protected with a fuse, which corresponds to the maximum current. This means max. 10A is to be protected with a 10A fuse (fast) respectively by a line circuit breaker 10A characteristics Z!
- It is recommended to externally protect the electronic power supply for head modules and I/O area with a 2A fuse (fast) respectively by a line circuit breaker 2A characteristics Z.
- The electronic power supply for the I/O area of the power module 007-1AB10 should also be externally protected with a 1A fuse (fast) respectively by a line circuit breaker 1A characteristics Z.

State of the electronic power supply via LEDs

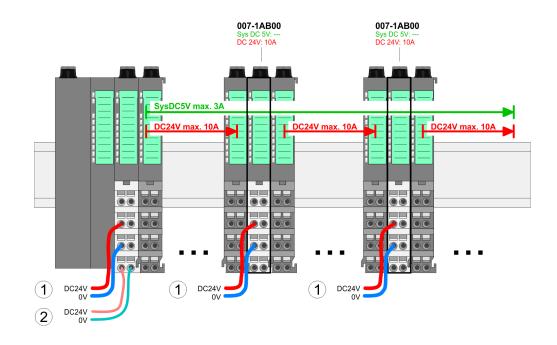

After PowerON of the System SLIO the LEDs RUN respectively MF get on so far as the sum current does not exceed 1A. With a sum current greater than 1A the LEDs may not be activated. Here the power module with the order number 007-1AB10 is to be placed between the peripheral modules.

Wiring > Wiring power modules

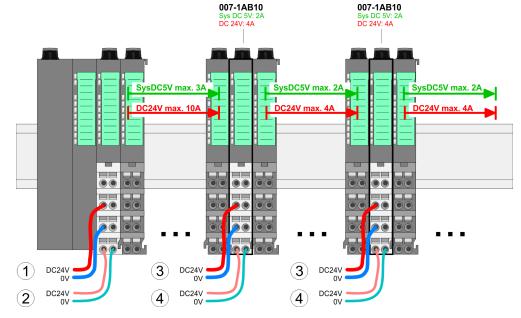

# Deployment of the power modules

Power module 007-1AB00

- If the 10A for the power section supply is no longer sufficient, you may use the power module with the order number 007-1AB00. So you have also the possibility to define isolated groups.
  - The power module with the order number 007-1AB10 is to be used if the 3A for the electronic power supply at the backplane bus is no longer sufficient. Additionally you get an isolated group for the DC 24V power section supply with max. 4A.
  - By placing the power module 007-1AB10 at the following backplane bus modules may be placed with a sum current of max. 2A. Afterwards a power module is to be placed again. To secure the power supply, the power modules may be mixed used.

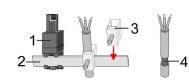

- (1) DC 24V for power section supply I/O area (max. 10A)
- (2) DC 24V for electronic power supply bus coupler and I/O area
- (3) DC 24V for power section supply I/O area (max. 4A)
- (4) DC 24V for electronic power supply I/O area

Wiring > Wiring power modules

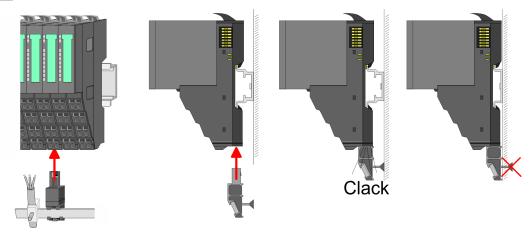

#### Shield attachment

- 1 Shield bus carrier
- 2 Shield bus (10mm x 3mm)
- 3 Shield clamp
- 4 Cable shield

To attach the shield the mounting of shield bus carriers are necessary. The shield bus carrier (available as accessory) serves to carry the shield bus to connect cable shields.

- **1.** Each System SLIO 8x periphery module has a carrier hole for the shield bus carrier. Push the shield bus carrier, until they engage into the module. With a flat mounting rail for adaptation to a flat mounting rail you may remove the spacer of the shield bus carrier.
- 2. Put your shield bus into the shield bus carrier.

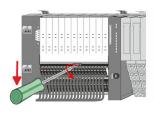

**3.** Attach the cables with the accordingly stripped cable screen and fix it by the shield clamp with the shield bus.

# 2.6 Demounting

# 2.6.1 Demounting CPU 01xC

# Proceeding

# **Remove connector**

**3.** Push the screwdriver down

Power-off your system.
 Remove connector:

lever, until it stops.

 $\Rightarrow$  The connector is unlocked and can be removed by turning downwards.

By means of a screwdriver there is the possibility to remove the connectors e.g. for

on its top side. Unlocking takes place by the following proceeding:

module exchange with a fix wiring. For this each connector has a release lever centrally

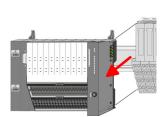

Push your screwdriver horizontally into the slot between connector and release

**CAUTION!** Via wrong operation such as pressing, the screwdriver upward the release lever may be damaged.

# **CPU replacement**

1.

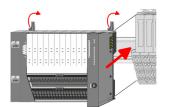

For demounting and exchange of a (head) module or a group of modules, due to mounting reasons you always have to remove the electronic module <u>right</u> beside. After mounting it may be plugged again.

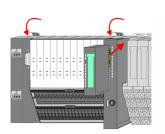

Press the unlocking lever at the lower side of the just mounted right module and pull it forward.

**2.** Turn all the locking lever of the CPU to be exchanged upwards.

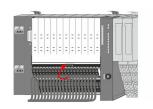

- 3. Pull the CPU forward.
- **4.** For mounting turn all the locking lever of the CPU to be mounted upwards.

Demounting > Demounting 8x periphery modules

# **Plug connector**

- **5.** To mount the CPU put it to the periphery module and push it, guided by the stripes, to the mounting rail.
- **6.** Turn all the locking lever downward, again.
- **7.** Plug again the electronic module, which you have removed before. For installation plug the electronic module guided by the strips at the lower side until this engages to the terminal module.

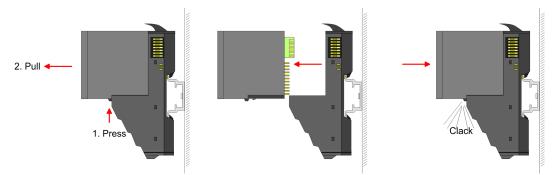

- Put the connector on the bottom edge and push it, as shown in the figure, with a rotation upwards into the release lever until it engages.
  - $\Rightarrow$  Now you can bring your system back into operation.

# 2.6.2 Demounting 8x periphery modules

# Proceeding

Exchange of an electronic module

1. Power-off your system.

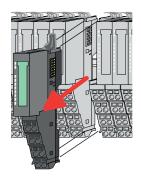

- **2.** For the exchange of a electronic module, the electronic module may be pulled forward after pressing the unlocking lever at the lower side of the module.
- **3.** For installation plug the new electronic module guided by the strips at the lower side until this engages to the terminal module.
  - ⇒ Now you can bring your system back into operation.

# Easy Maintenance

'Easy Maintenance' means the support for adding and removing electronic modules during operation without having to restart the system. If this is supported by your head module, you will find more detailed information on this in the "Deployment" chapter. & Chap. 2.6.4 'Easy Maintenance' page 41

# Exchange of a periphery module

- 2 Power-

- **1.** Power-off your system.
- **2.** Remove if exists the wiring of the module.

3.

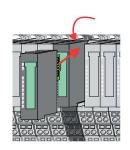

For demounting and exchange of a (head) module or a group of modules, due to mounting reasons you always have to remove the electronic module <u>right</u> beside. After mounting it may be plugged again.

Press the unlocking lever at the lower side of the just mounted right module and pull it forward.

**4.** Turn the locking lever of the module to be exchanged upwards.

- **5.** Pull the module.
- **6.** For mounting turn the locking lever of the module to be mounted upwards.

- **7.** To mount the module put it to the gap between the both modules and push it, guided by the stripes at both sides, to the mounting rail.
- **8.** Turn the locking lever downward, again.

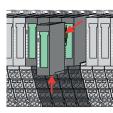

**10.** Wire your module.

**9.** Plug again the electronic module, which you have removed before.

 $\,\Rightarrow\,\,$  Now you can bring your system back into operation.

Demounting > Demounting 8x periphery modules

#### Exchange of a module group

1. Power-off your system.

2. Remove if exists the wiring of the module group.

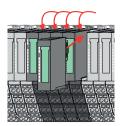

For demounting and exchange of a (head) module or a group of modules, due to mounting reasons you always have to remove the electronic module right beside. After mounting it may be plugged again.

Press the unlocking lever at the lower side of the just mounted right module near the module group and pull it forward.

**4.** Turn all the locking lever of the module group to be exchanged upwards.

- **5.** Pull the module group forward.
- **6.** For mounting turn all the locking lever of the module group to be mounted upwards.
- 7. To mount the module group put it to the gap between the both modules and push it, guided by the stripes at both sides, to the mounting rail.
- **8.** Turn all the locking lever downward, again.

- **9.** Plug again the electronic module, which you have removed before.
- **10.** Wire your module group.
  - $\Rightarrow$  Now you can bring your system back into operation.

Demounting > Demounting 16x periphery modules

# 2.6.3 Demounting 16x periphery modules

#### Proceeding

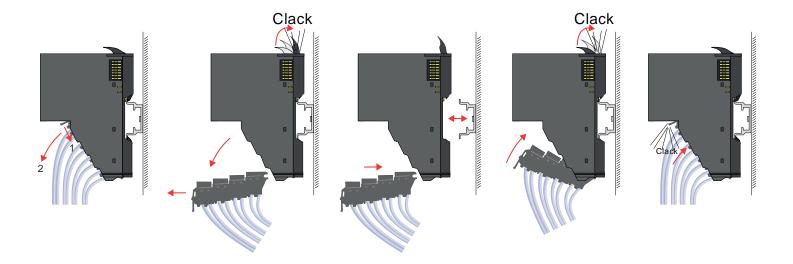

Exchange of an electronic unit

**1.** Power-off your system.

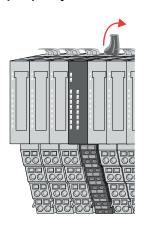

**2.** To replace an electronic unit, you can push down and pull off the terminal block after releasing the lock.

To mount the terminal block, place it horizontally on the lower side of the electronic unit and push it towards the electronic unit until it clicks into place.

 $\Rightarrow$  Now you can bring your system back into operation.

# Exchange of a 16x periphery module

**1.** Power-off your system.

**2.** Remove if exists the wiring of the module respectively the wired terminal block.

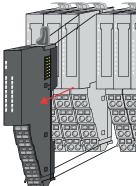

3.

*In contrast to 8x periphery modules, you can directly demount and mount 16x periphery modules.* 

Turn the locking lever of the module to be exchanged upwards.

Demounting > Demounting 16x periphery modules

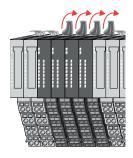

- **4.** Pull the module.
- **5.** For mounting turn the locking lever of the module to be mounted upwards.

**6.** To mount the module put it to the gap between the both modules and push it, guided by the stripes at both sides, to the mounting rail.

- **7.** Turn the locking lever downward, again.
- **8.** Wire your module respectively plug the wired terminal block again.
  - ⇒ Now you can bring your system back into operation.

Exchange of a module group

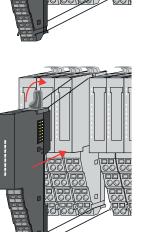

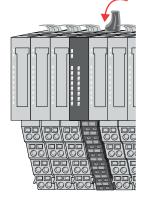

- **1.** Power-off your system.
- **2.** Remove if exists the wiring of the module group respectively the wired terminal blocks.

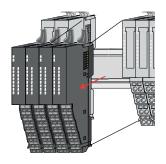

*In contrast to 8x periphery modules, you can directly demount and mount 16x periphery modules.* 

Turn all the locking lever of the module group to be exchanged upwards.

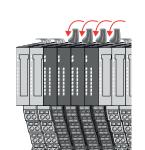

Demounting > Demounting 16x periphery modules

**6.** To mount the module group put it to the gap between the both modules and push it, guided by the stripes at both sides, to the mounting rail.

**5.** For mounting turn all the locking lever of the module group to be mounted upwards.

7. Turn all the locking lever downward, again.

**4.** Pull the module group forward.

- **8.** Wire your module group respectively plug the wired terminal blocks again.
  - $\Rightarrow$  Now you can bring your system back into operation.

#### 2.6.4 Easy Maintenance

Overview

*Easy Maintenance* means the support for adding and removing an electronic module during operation without having to restart the system. Here the following behavior is shown by the example of a CPU:

- Electronic module is removed
  - The CPU detects a module failure on the backplane bus.
  - Diagnostic message 'System SLIO bus failure' (0x39D0) is triggered.
  - OB 86 is called. If this is not available, the CPU switches to STOP otherwise it remains in RUN.
  - The SF LED of the CPU lights up.
  - The I/O data of all modules become invalid.
- Identical electronic module is plugged
  - The CPU detects the module return on the backplane bus.
  - The SF-LED of the CPU gets off.
  - All RUN LEDs on the modules get on and the MF LEDs get off.
  - Diagnostic message 'System SLIO bus recovery' (0x38D0) is triggered.
  - OB 86 is called. If this is not available, the CPU switches to STOP otherwise it remains in RUN.
  - The I/O data of all modules become valid again.
- Wrong electronic module is plugged
  - The CPU detects the wrong module.
  - Diagnostic message 'System SLIO bus recovery, but expected configuration does not match actual configuration' (0x38D1) is triggered.
  - The SF LED of the CPU remains on.
  - The MF LED of the wrong module flashes.
  - OB 86 is called. If this is not available, the CPU switches to STOP otherwise it remains in RUN.
  - With the exception of the wrong module, the I/O data of all modules become valid again.

#### CAUTION!

Please note that only electronic modules may be exchanged during operation! Replacing an 8x or 16x periphery module during operation can damage the module and the system!

Please note that the CPU switches to STOP, if there is no OB 86 configured when adding or removing System SLIO modules! Trouble shooting - LEDs

## 2.7 Trouble shooting - LEDs

General

Each module has the LEDs RUN and MF on its front side. Errors or incorrect modules may be located by means of these LEDs.

In the following illustrations flashing LEDs are marked by  $\dot{\mathfrak{P}}$ .

Sum current of the electronic power supply exceeded

*Behaviour*: After PowerON the RUN LED of each module is off and the MF LED of each module is sporadically on.

Reason: The maximum current for the electronic power supply is exceeded.

*Remedy*: As soon as the sum current of the electronic power supply is exceeded, always place the power module 007-1AB10. *Chap. 2.5.4 Wiring power modules' page 29* 

#### Error in configuration

*Behaviour*: After PowerON the MF LED of one module respectively more modules flashes. The RUN LED remains off.

*Reason*: At this position a module is placed, which does not correspond to the configured module.

RUN

MF

RUN

MF

Remedy: Match configuration and hardware structure.

RUN

MF

Module failure

*Behaviour*: After PowerON all of the RUN LEDs up to the defective module are flashing. With all following modules the MF LED is on and the RUN LED is off.

*Reason*: The module on the right of the flashing modules is defective.

Remedy: Replace the defective module.

# 2.8 Industrial security and installation guidelines

# 2.8.1 Industrial security in information technology

Latest version	This chapter can also be found as a guide <i>'IIndustrial IT Security'</i> at <u>www.yaskawa.eu.com</u>		
Hazards	The topic of data security and access protection has become increasingly important in the industrial environment. The increased networking of entire industrial systems to the net- work levels within the company together with the functions of remote maintenance have all served to increase vulnerability. Hazards can arise from:		
	<ul> <li>Internal manipulation such as technical errors, operating and program errors and deliberate program or data manipulation.</li> <li>External manipulation such as software viruses, worms and Trojans.</li> <li>Human carelessness such as password phishing.</li> </ul>		
Precautions	The most important precautions to prevent manipulation and loss of data security in the industrial environment are:		
	<ul> <li>Encrypting the data traffic by means of certificates.</li> <li>Filtering and inspection of the traffic by means of VPN - "Virtual Private Networks".</li> <li>Identification of the user by "Authentication" via save channels.</li> <li>Segmenting in protected automation cells, so that only devices in the same group can exchange data.</li> <li>Deactivation of unnecessary hardware and software.</li> </ul>		
Further Information	You can find more information about the measures on the following websites:		
	<ul> <li>Federal Office for Information Technology <u>www.bsi.bund.de</u></li> <li>Cybersecurity &amp; Infrastructure Security Agency <u>us-cert.cisa.gov</u></li> <li>VDI / VDE Society for Measurement and Automation Technology <u>www.vdi.de</u></li> </ul>		

Industrial security and installation guidelines > Industrial security in information technology

#### 2.8.1.1 **Protection of hardware and applications**

Precautions

- Do not integrate any components or systems into public networks.
  - Use VPN "Virtual Private Networks" for use in public networks. This allows you to control and filter the data traffic accordingly.
- Always keep your system up-to-date.
  - Always use the latest firmware version for all devices.
  - Update your user software regularly.
- Protect your systems with a firewall.
  - The firewall protects your infrastructure internally and externally.
  - This allows you to segment your network and isolate entire areas.
- Secure access to your plants via user accounts.
  - If possible, use a central user management system.
  - Create a user account for each user for whom authorization is essential.
  - Always keep user accounts up-to-date and deactivate unused user accounts.
- Secure access to your plants via secure passwords.
  - Change the password of a standard login after the first start.
  - Use strong passwords consisting of upper/lower case, numbers and special characters. The use of a password generator or manager is recommended.
  - Change the passwords according to the rules and guidelines that apply to your application.
- Deactivate inactive communication ports respectively protocols.
  - Only the communication ports that are used for communication should be activated.
  - Only the communication protocols that are used for communication should be activated.
- Consider possible defence strategies when planning and securing the system.
  - The isolation of components alone is not sufficient for comprehensive protection. An overall concept is to be drawn up here, which also provides defensive measures in the event of a cyber attack.
  - Periodically carry out threat assessments. Among others, a comparison is made here between the protective measures taken and those required.
- Limit the use of external storage media.
  - Via external storage media such as USB memory sticks or SD memory cards, malware can get directly into a system while bypassing a firewall.
  - External storage media or their slots must be protected against unauthorized physical access, e.g. by using a lockable control cabinet.
  - Make sure that only authorized persons have access.
  - When disposing of storage media, make sure that they are safely destroyed.
- Use secure access paths such as HTTPS or VPN for remote access to your plant.
- Enable security-related event logging in accordance with the applicable security policy and legal requirements for data protection.

#### 2.8.1.2 Protection of PC-based software

Precautions

Since PC-based software is used for programming, configuration and monitoring, it can also be used to manipulate entire systems or individual components. Particular caution is required here!

- Use user accounts on your PC systems.
  - If possible, use a central user management system.
  - Create a user account for each user for whom authorization is essential.
  - Always keep user accounts up-to-date and deactivate unused user accounts.
- Protect your PC systems with secure passwords.
  - Change the password of a standard login after the first start.
  - Use strong passwords consisting of upper/lower case, numbers and special characters. The use of a password generator or manager is recommended.
  - Change the passwords according to the rules and guidelines that apply to your application.
- Enable security-related event logging in accordance with the applicable security policy and legal requirements for data protection.
- Protect your PC systems by security software.
  - Install virus scanners on your PC systems to identify viruses, trojans and other malware.
  - Install software that can detect phishing attacks and actively prevent them.
- Always keep your software up-to-date.
- Update your operating system regularly.
- Update your software regularly.
- Make regular backups and store the media at a safe place.
- Regularly restart your PC systems. Only boot from storage media that are protected against manipulation.
- Use encryption systems on your storage media.
- Perform security assessments regularly to reduce the risk of manipulation.
- Use only data and software from approved sources.
- Uninstall software which is not used.
- Disable unused services.

- Activate a password-protected screen lock on your PC systems.
- Always lock your PC systems as soon as you leave your PC workstation.
- Do not click any links that come from unknown sources. If necessary ask, e.g. on emails.
- Use secure access paths such as HTTPS or VPN for remote access to your PC system.

#### 2.8.2 Installation guidelines

**General** The installation guidelines contain information about the interference free deployment of a PLC system. There is the description of the ways, interference may occur in your PLC, how you can make sure the electromagnetic compatibility (EMC), and how you manage the isolation.

What does EMC mean? Electromagnetic compatibility (EMC) means the ability of an electrical device, to function error free in an electromagnetic environment without being interfered respectively without interfering the environment.

The components are developed for the deployment in industrial environments and meets high demands on the EMC. Nevertheless you should project an EMC planning before installing the components and take conceivable interference causes into account.

Industrial security and installation guidelines > Installation guidelines

# Possible interference causes

Electromagnetic interferences may interfere your control via different ways:

- Electromagnetic fields (RF coupling)
- Magnetic fields with power frequency
- Bus system
- Power supply
- Protected earth conductor

Depending on the spreading medium (lead bound or lead free) and the distance to the interference cause, interferences to your control occur by means of different coupling mechanisms.

There are:

- galvanic coupling
- capacitive coupling
- inductive coupling
- radiant coupling

#### **Basic rules for EMC**

In the most times it is enough to take care of some elementary rules to guarantee the EMC. Please regard the following basic rules when installing your PLC.

- Take care of a correct area-wide grounding of the inactive metal parts when installing your components.
  - Install a central connection between the ground and the protected earth conductor system.
  - Connect all inactive metal extensive and impedance-low.
  - Please try not to use aluminium parts. Aluminium is easily oxidizing and is therefore less suitable for grounding.
- When cabling, take care of the correct line routing.
  - Organize your cabling in line groups (high voltage, current supply, signal and data lines).
  - Always lay your high voltage lines and signal respectively data lines in separate channels or bundles.
  - Route the signal and data lines as near as possible beside ground areas (e.g. suspension bars, metal rails, tin cabinet).
- Proof the correct fixing of the lead isolation.
  - Data lines must be shielded.
  - Analog lines must be shielded. When transmitting signals with small amplitudes the one sided laying of the isolation may be favourable.
  - Cables for frequency inverters, servo and stepper motors must be shielded.
  - Lay the line isolation extensively on an isolation/protected earth conductor rail directly after the cabinet entry and fix the isolation with cable clamps.
  - Make sure that the isolation/protected earth conductor rail is connected impedance-low with the cabinet.
  - Use metallic or metallised plug cases for isolated data lines.
- In special use cases you should appoint special EMC actions.
  - Consider to wire all inductivities with erase links.
  - Please consider luminescent lamps can influence signal lines.
- Create a homogeneous reference potential and ground all electrical operating supplies when possible.
  - Please take care for the targeted employment of the grounding actions. The grounding of the PLC serves for protection and functionality activity.
  - Connect installation parts and cabinets with your PLC in star topology with the isolation/protected earth conductor system. So you avoid ground loops.
  - If there are potential differences between installation parts and cabinets, lay sufficiently dimensioned potential compensation lines.

**Isolation of conductors** Electrical, magnetically and electromagnetic interference fields are weakened by means of an isolation, one talks of absorption. Via the isolation rail, that is connected conductive with the rack, interference currents are shunt via cable isolation to the ground. Here you have to make sure, that the connection to the protected earth conductor is impedancelow, because otherwise the interference currents may appear as interference cause.

When isolating cables you have to regard the following:

- If possible, use only cables with isolation tangle.
- The hiding power of the isolation should be higher than 80%.
- Normally you should always lay the isolation of cables on both sides. Only by means of the both-sided connection of the isolation you achieve high quality interference suppression in the higher frequency area. Only as exception you may also lay the isolation one-sided. Then you only achieve the absorption of the lower frequencies. A one-sided isolation connection may be convenient, if:
  - the conduction of a potential compensating line is not possible.
  - analog signals (some mV respectively µA) are transferred.
  - foil isolations (static isolations) are used.
- With data lines always use metallic or metallised plugs for serial couplings. Fix the isolation of the data line at the plug rack. Do not lay the isolation on the PIN 1 of the plug bar!
- At stationary operation it is convenient to strip the insulated cable interruption free and lay it on the isolation/protected earth conductor line.
- To fix the isolation tangles use cable clamps out of metal. The clamps must clasp the isolation extensively and have well contact.
- Lay the isolation on an isolation rail directly after the entry of the cable in the cabinet. Lead the isolation further on to your PLC and don't lay it on there again!

#### CAUTION!

Please regard at installation!

At potential differences between the grounding points, there may be a compensation current via the isolation connected at both sides.

Remedy: Potential compensation line

## 2.9 General data for the System SLIO

Conformity and approval		
Conformity		
CE	2014/35/EU	Low-voltage directive
	2014/30/EU	EMC directive
Approval		
UL	-	Refer to Technical data
Others		
RoHS	2011/65/EU	Restriction of the use of certain hazardous substances in electrical and electronic equipment

1) Due to the high-energetic single pulses with Surge an appropriate external protective circuit with lightning protection elements like conductors for lightning and overvoltage is necessary.

# 2.9.1 Use in difficult operating conditions

	Without additional protective measures, the products must not be used in locations with difficult operating conditions; e.g. due to:			
	<ul> <li>dust generation</li> <li>chemically active substances (corrosive vapors or gases)</li> </ul>			
	<ul> <li>strong electric or magnetic fields</li> </ul>			

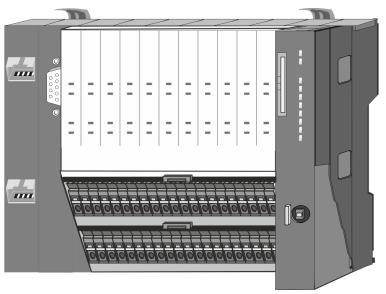

Properties

# 3 Hardware description

## 3.1 **Properties**

CPU 013-CCF0R00

- SPEED7 technology integrated
- Programmable via SPEED7 Studio, Siemens SIMATIC Manager or TIA Portal
- Integrated work memory 64kbyte (32kbyte code, 32kbyte data)
- Work memory expandable up to 128kbyte (64kbyte code, 64kbyte data)
- 128kbyte load memory integrated
- Slot for external storage media (lockable)
- Status LEDs for operating state and diagnostics
- X1/X2: Ethernet PG/OP channel (switch) for active and passive communication integrated
- X3: MPI(PB) interface: MPI interface with via VSC unlock able field bus functions
- Integrated Digital I/Os: DI 16xDC24V; DO 12xDC24V, 0,5A
- Integrated Analog Input : AI 2x12Bit (single ended)
- 4 channels for counter, frequency measurement and 2 channels for pulse width modulation
- Pulse Train via SFB 49 (PULSE)
- PROFINET IO controller and I-Device via Ethernet PG/OP channel
- OPC UA project via Ethernet PG/OP channel
- WebVisu project via Ethernet PG/OP channel
- Up to 64 SLIO modules placeable
- I/O address area digital/analog 2048byte
- 512 timer/counter, 8192 flag byte

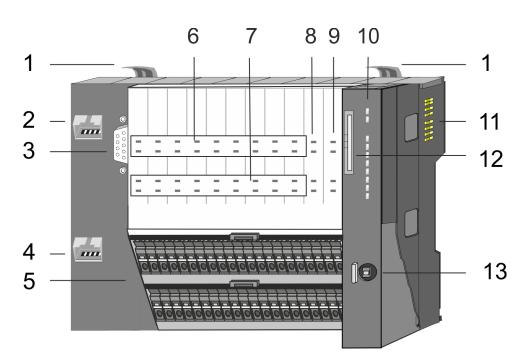

#### **Ordering data**

Туре	Order number	Description
CPU 013C	013-CCF0R00	Compact CPU 013C with options to extend work memory and field bus inter- face with DI 16xDC24V, DO 12xDC24V 0.5A, AI 2x12Bit and 4 channels technological function

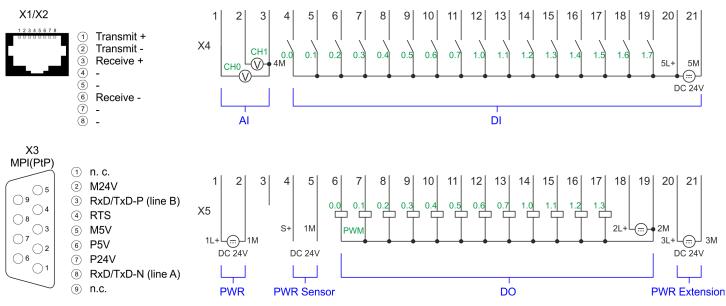

Structure > Interfaces

# 3.2 Structure 3.2.1 Compact CPU CPU 013C

#### 3.2.2 Interfaces

X1/X2: Ethernet PG/OP	8pin RJ45 jack:
channel	<ul> <li>The RJ45 jack serves as interface to the Ethernet PG/OP channel.</li> <li>This interface allows you to program respectively remote control your CPU and to access the internal web server.</li> <li>The Ethernet PG/OP channel (X1/X2) is designed as switch. This enables PG/OP communication via the connections X1 and X2.</li> <li>Configurable connections are possible.</li> <li>DHCP respectively the assignment of the network configuration with a DHCP server is supported.</li> <li>Default diagnostics addresses: 2025 2040</li> <li>At the first commissioning respectively after a factory reset the Ethernet PG/OP channel has no IP address. For online access to the CPU via the Ethernet PG/OP channel, valid IP address parameters have to be assigned to this by means of your configuration tool. This is called "initialization".</li> <li>Via the Ethernet PG/OP channel, you have access to:     <ul> <li>Device website, where you can find information on firmware status, connected peripherals, current cycle times, etc.</li> <li>OPC UA project, which is to be created in the OPC UA Configurator.</li> <li>WebVisu project, which is to be created in the SPEED7 Studio.</li> </ul> </li> </ul>
	<ul> <li>PROFINET IO controller or the PROFINET I-Device.</li> </ul>
	🌣 Chap. 4.7 'Hardware configuration - Ethernet PG/OP channel' page 80
	& Chap. 9 'Deployment PG/OP communication - productive' page 222
X3: MPI(PtP) interface	9pin SubD jack: (isolated)
	The interface supports the following functionalities, which are switch able:
	<ul> <li>MPI (default / after overall reset)         The MPI interface serves for the connection between programming unit and CPU. By means of this the project engineering and programming happens. In addition MPI serves for communication between several CPUs or between HMIs and CPU. Standard setting is MPI address 2.     </li> <li>PtP         The RS485 interface can be switched to PtP functionality &amp; <i>Chap. 4.9 'Setting product specific CPU parameters' page 90</i>. Using the <i>PtP</i> functionality the RS485 interface is allowed to connect via serial point-to-point connection to different source res. target systems.     </li> <li>The following protocols are supported:         <ul> <li>ASCII</li> <li>STX/ETX</li> <li>3964R</li> <li>USS</li> </ul> </li> </ul>
	<ul> <li>Modbus master (ASCII, RTU)</li> <li>PROFIBUS DP (option) The PROFIBUS functionality of this interface can be activated by configuring the sub module X1 <i>(MPI/DP')</i> of the CPU in the hardware configuration. <i>S Chap. 11 (Option: Deployment PROFIBUS communication')</i> page 262</li> </ul>
	<ul> <li>Enable bus functionality via VSC</li> <li>To switch the interface X3 MPI(PtP) to PROFIBUS functionality you have to activate the according bus functionality by means of a Yaskawa VSC storage media. By plugging the VSC storage card and then an overall reset the according functionality is activated. Schap. 4.16 'Deployment storage media - VSD, VSC' page 119</li> </ul>

# X5: Electronic power supply

The CPU has an integrated power supply. The power supply has to be provided with DC 24V. Via the power supply not only the internal electronic of the CPU is provided with voltage, but also the electronic from the integrated IO modules and the sensor output. The power supply is protected against polarity inversion and over current.

#### 3.2.3 Memory management

#### General

The CPU has an integrated memory. Information about the capacity of the memory may be found at the front of the CPU. The memory is divided into the following parts:

- Load memory 128kbyte
- Code memory (50% of the work memory)
- Data memory (50% of the work memory)
- Work memory 64kbyte
  - There is the possibility to extend the work memory to its maximum capacity 128kbyte by means of a VSC.

#### 3.2.4 Slot for storage media

#### Overview

In this slot you can insert the following storage media:

- VSD VIPA SD-Card
  - External memory card for programs and firmware.
- VSC VIPASetCard
  - External memory card (VSD) for programs and firmware with the possibility to unlock optional functions like work memory and field bus interfaces.

$\bigcirc$	To avoid malfunctions, you should use memory cards of Yaskawa. These
	correspond to the industrial standard. A list of the currently available VSD
	respectively VSC can be found at www.yaskawa.eu.com

#### 3.2.5 Buffering mechanisms

The System SLIO CPU has a capacitor-based mechanism to buffer the internal clock in case of power failure for max. 30 days. With PowerOFF the content of the RAM is automatically stored in the Flash (NVRAM).

#### CAUTION!

Please connect the CPU for approximately 1 hour to the power supply, so that the internal buffering mechanism is loaded accordingly.

In case of failure of the buffer mechanism Date and Time 01.09.2009 00:00:00 set. Additionally, you receive a diagnostics message. *Schap. 4.20 'Diagnostic entries' page 125* 

### 3.2.6 Operating mode switch

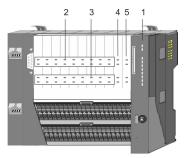

#### General

- With the operating mode switch you may switch the CPU between STOP and RUN.
- During the transition from STOP to RUN the operating mode START-UP is driven by the CPU.

Placing the switch to MR (Memory Reset), you request an overall reset with following load from memory card, if a project there exists.

#### 3.2.7 LEDs

- 1 LEDs CPU part
- DI +x: LEDs integrated DI (DI +0.0 ... DI +1.7) DO +x: LEDs integrated DO (DO +0.0 ... DO +1.3) xL+: LEDs power supply 2 3
- 4 5 xF: LEDs error

#### LEDs CPU

# LEDs Ethernet PG/OP channel

L/A1	Description
L/A2	
green	
	The corresponding Ethernet PG/OP channel is physically connected to the Ethernet.
	The corresponding Ethernet PG/OP channel is not physically connected to the Ethernet.
	The corresponding Ethernet PG/OP channel indicates Ethernet activity, here the LED flickers.

### **LEDs PROFIBUS** Dependent on the mode of operation the LEDs show information about the state of operation of the PROFIBUS part according to the following pattern:

DE	BF1	Description
green	<b>red</b>	
Master ope	ration	
		Master has no project, this means the interface is deactivated respectively the master configured without slaves with no errors.
ZHz 2Hz		CPU is in STOP state, the master is in "clear" state. All the slaves are in DE (data exchange) and the outputs of the slaves are disabled.
		CPU is in RUN state, the master is in "operate" state. All the slaves are in DE. The outputs are enabled.
	ZHz	CPU is in RUN state, at least 1 slave is missing and at least 1 slave is in DE.
ZHz 2Hz	2Hz	CPU is in STOP state, the master is in "clear" state. At least 1 slave is missing and at least 1 slave is in DE.
		PROFIBUS is interrupted (no communication possible).
	ZHz	At least 1 slave is missing and no slave is in DE.
Х	ZHz	At least 1 slave is not in DE.
Slave oper	ation	
		Slave has no configuration.
		There is a bus error.
ZHz		Slave exchanges data with the master.
		Slave CPU is in state STOP.
		Slave exchanges data with the master.
		Slave CPU is in state RUN.

Start-up behavior

# 4 Deployment CPU 013-CCF0R00

# 4.1 Please note!

$\bigcirc$	The following descriptions always refer to the usage in the Siemens
	SIMATIC Manager. Information on usage in the SPEED7 Studio or Sie- mens TIA Portal can be found here:

- & Chap. 12 'Configuration with SPEED7 Studio' page 275
- ♦ Chap. 13 'Configuration with TIA Portal' page 302

## 4.2 Assembly

## 4.3 Start-up behavior

Turn on power supply

- The CPU checks whether a project AUTOLOAD.WLD exists on the memory card. If so, an overall reset is executed and the project is automatically loaded from the memory card.
- The CPU checks whether a command file with the name VIPA\_CMD.MMC exists on the memory card. If so the command file is loaded from the memory card and the commands are executed.
- After PowerON and CPU STOP the CPU checks if there is a \*.pkb file (firmware file) on the memory card. If so, this is shown by the CPU by blinking LEDs and the firmware may be installed by an update request. Chap. 4.14 'Firmware update' page 114
- The CPU checks if a previously activated VSC is inserted. If not, the SF LED gets on and a diagnostics entry is released. The CPU switches to STOP after 72 hours. With a just installed VSC activated functions remain activated. *Chap. 4.20 Diagnostic entries' page 125*

After this the CPU switches to the operating mode, which is set on the operating mode switch.

**Delivery state** In the delivery state the CPU is overall reset. After a STOP→RUN transition the CPU switches to RUN without program.

# 4.4 Addressing

## 4.4.1 Overview

To provide specific addressing of the installed peripheral modules, certain addresses must be allocated in the CPU. This address mapping is in the CPU as hardware configuration. If there is no hardware configuration, depending on the slot, the CPU assigns automatically peripheral addresses for digital in-/output modules starting with 0 and analog modules are assigned to even addresses starting with 256.

## 4.4.2 Default address assignment of the I/O part

Sub module	Input address	Access	Description
AI5/AO2	800	WORD	Analog input channel 0 (X4)
	802	WORD	Analog input channel 1 (X4)

Sub module	Input address	Access	Description
DI24/DO16	<i>DI24/DO16</i> 136	BYTE	Digital input I+0.0 I+0.7 (X4)
	137	BYTE	Digital input I+1.0 I+1.7 (X4)

Sub module	Input address	Access	Description
Counter	816	DINT	Channel 0: Counter value / Frequency value
	820	DINT	Channel 1: Counter value / Frequency value
	824	DINT	Channel 2: Counter value / Frequency value
	828	DINT	Channel 3: Counter value / Frequency value

Sub module	Output address	Access	Description
DI24/DO16	DI24/DO16 136	BYTE	Digital output Q+0.0 Q+0.7 (X5)
	137	BYTE	Digital output Q+1.0 Q+1.3 (X5)

Sub module	Output address	Access	Description
Counter         816           820         824           828         828	DWORD	reserved	
	820	DWORD	reserved
	824	DWORD	reserved
	828	DWORD	reserved

Addressing > Addressing periphery modules

## 4.4.3 Addressing periphery modules

The CPU 013-CCF0R00 provides an periphery area (address 0 ... 2047) and a process image of the in- and outputs (each address default 0 ... 127). The size of the process image can be adjusted via the parametrization.  $\Leftrightarrow$  *Chap. 4.8 'Setting standard CPU parameters' page 86* 

The process image is updated automatically when a cycle has been completed. The process image is divided into two parts:

- Process image of the inputs (PII)
- Process image of the outputs (PIQ)

		1		3		5	
		2		4		6	
	2 Pe 3 Pro 4 Pro 5 Pro	riphery area: 0 riphery area : 0 ocess image of the ocess image of the ocess image of the ocess image of the	2047 e inputs (PII): 0 e inputs (PII): m e outputs (PIQ):	ax. 2047 0 127			
Max. number of modules		64 SLIO modules o modules.	can be connect	ed to a SLIO CPU	J. This s	um includes powe	er and
Define addresses by hard- ware configuration	You may access the modules with read respectively write accesses to the peripheral bytes or the process image. To define addresses a hardware configuration may be used. For this, click on the properties of the according module and set the wanted address.

## 4.5 Hardware configuration - CPU

Precondition

- The configuration of the CPU takes place at the 'hardware configurator' of the Siemens SIMATIC Manager V 5.5 SP2 and up.
- The configuration of the System SLIO CPU happens by means of a virtual PROFINET IO device 'VIPA SLIO System'. The 'VIPA SLIO System' is to be installed in the hardware catalog by means of the GSDML.

For project engineering a thorough knowledge of the Siemens SIMATIC Manager and the Siemens hardware configurator is required!

Installation IO device 'VIPA SLIO System' The installation of the PROFINET IO devices 'VIPA SLIO System' happens in the hardware catalog with the following approach:

- **1.** Go to the 'Download Center' of www.yaskawa.eu.com.
- **2.** Load under 'GSDML SLIO' the according file for your System SLIO.
- **3.** Extract the file into your working directory.
- **4.** Start the Siemens hardware configurator.
- **5.** Close all the projects.
- 6. ▶ Select 'Options → Install new GSD file'
- **7.** Navigate to your working directory and install the according GSDML file.
  - After the installation according PROFINET IO device can be found at 'PROFINET IO → Additional field devices → I/O → ... SLIO System'

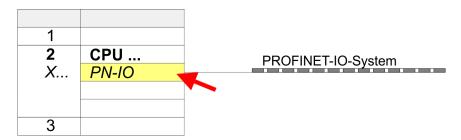

#### Proceeding

- In the Siemens SIMATIC Manager the following steps should be executed:
  - **1.** Start the Siemens hardware configurator with a new project.
  - **2.** Insert a profile rail from the hardware catalog.
  - 3. Place at 'Slot'-Number 2 the CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).

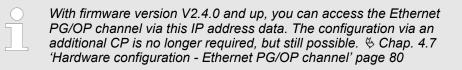

Slot	Module
1	
2	CPU 314C-2PN/DP
X1	MPI/DP
X2	PN-IO
Х2	Port 1
X2	Port 2
3	
	· ]

- **4.** Click at the sub module '*PN-IO*' of the CPU.
- 5. ▶ Select 'Context menu → Insert PROFINET IO System'.

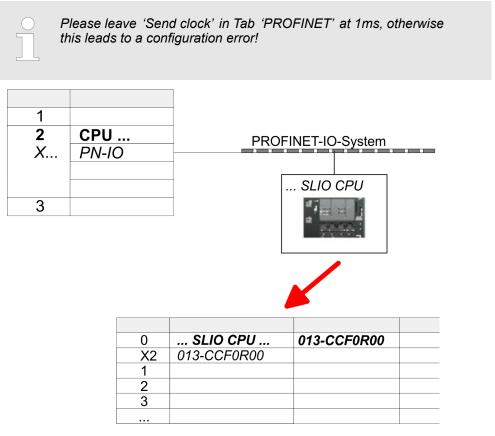

Hardware configuration - CPU

**6.** Use [New] to create a new subnet and assign valid IP address data for your PROFINET system.

- **7.** Click at the sub module '*PN-IO*' of the CPU and open with '*Context menu*  $\rightarrow$  *Properties*' the properties dialog.
- **8.** Enter at *'General'* a device name. The device name must be unique at the Ethernet subnet.

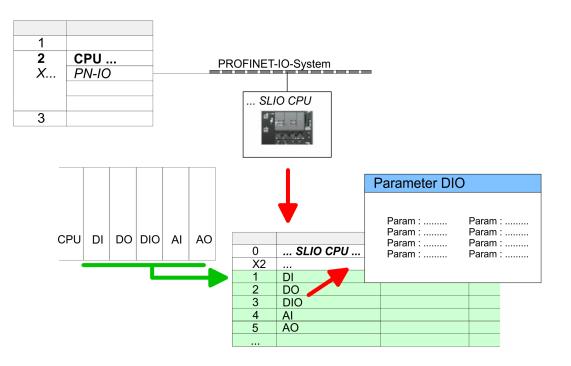

- 9. Navigate in the hardware catalog to the directory 'PROFINET IO
   → Additional field devices → I/O → ... SLIO System' and connect the IO device '013-CCF0R00 CPU' to your PROFINET system.
  - ⇒ In the slot overview of the PROFINET IO device 'VIPA SLIO System' the CPU is already placed at slot 0. From slot 1 you can place your System SLIO modules.

# 4.6 Hardware configuration - System SLIO modules

**System SLIO backplane bus** To connect System SLIO modules, the CPU has a backplane bus, which must additionally to be supplied. Here up to 64 System SLIO modules can be connected.

Proceeding

- **1.** Perform, if not already done, a hardware configuration for the CPU.  $\Leftrightarrow$  Chap. 4.5 *Hardware configuration CPU' page 77*
- **2.** Starting with slot 1 place in the slot overview of the PROFINET IO device 'VIPA SLIO System' your System SLIO modules in the plugged sequence.
- **3.** Parametrize if necessary the modules and assign valid addresses, so that they can directly be addressed.

Hardware configuration - Ethernet PG/OP channel

# 4.7 Hardware configuration - Ethernet PG/OP channel

## Overview

	<ul> <li>Please note!         <ul> <li>At the first commissioning respectively after a reset to factory setting the Ethernet interface has no IP address.</li> <li>For online access, you have to assign valid IP address data to it by means of "Initialization".</li> <li>After initialization, you can transfer the IP address data to your project.</li> </ul> </li> </ul>
	The CPU has an integrated Ethernet PG/OP channel. This channel allows you to pro- gram and remote control your CPU.
	<ul> <li>The Ethernet PG/OP channel (X1/X2) is designed as switch. This enables PG/OP communication via the connections X1 and X2.</li> <li>Configurable connections are possible.</li> </ul>
	DHCP respectively the assignment of the network configuration with a DHCP server is supported.
	Default diagnostics addresses: 2025 2040
	<ul> <li>Via the Ethernet PG/OP channel, you have access to:</li> <li>Device website, where you can find information on firmware status, connected peripherals, current cycle times, etc.</li> </ul>
	- OPC UA project, which is to be created in the OPC UA Configurator.
	<ul> <li>WebVisu project, which is to be created in the SPEED7 Studio.</li> <li>PROFINET IO controller or the PROFINET I-Device.</li> </ul>
Assembly and commis- sioning	<b>1.</b> Install your System SLIO with your CPU.

#### **2.** Wire the system by connecting cables for voltage supply and signals.

- 3. Connect the one of the Ethernet jacks (X1, X2) of the Ethernet PG/OP channel to Ethernet.
- **4.** Switch on the power supply.
  - ⇒ After a short boot time the CP is ready for communication. He possibly has no IP address data and requires an initialization.

Hardware configuration - Ethernet PG/OP channel > Take IP address parameters in project

# "Initialization" via PLC functions

The initialization via PLC functions takes place with the following proceeding:

Determine the current Ethernet (MAC) address of your Ethernet PG/OP channel. This can be found at the front of your CPU with the name "MAC PG/OP: ...".

MAC PG/OP: 00-20-D5-77-05-10

Assign IP address parameters You get valid IP address parameters from your system administrator. The assignment of the IP address data happens online in the Siemens SIMATIC Manager starting with version V 5.5 & SP2 with the following proceeding:

- Start the Siemens SIMATIC Manager and set via 'Options
   → Set PG/PC interface the access path to 'TCP/IP -> Network card ....'.
- **2.** Open with '*PLC*  $\rightarrow$  *Edit Ethernet Node n*' the dialog window with the same name.
- 3. To get the stations and their MAC address, use the [Browse] button or type in the MAC Address. The Mac address may be found at the 1. label beneath the front flap of the CPU.
- **4.** Choose if necessary the known MAC address of the list of found stations.
- 5. Either type in the IP configuration like IP address, subnet mask and gateway.
- 6. Confirm with [Assign IP configuration].
  - ⇒ Direct after the assignment the Ethernet PG/OP channel may be reached online by these address data. The value remains as long as it is reassigned, it is overwritten by a hardware configuration or an factory reset is executed.

## 4.7.1 Take IP address parameters in project

2 variants for configuration From firmware version V2.4.0 and up, you have the following options for configuring the Ethernet PG/OP channel:

- Configuration via integrated CPU interface (firmware version V2.4.0 and up only).
- Configuration via additional CP (all firmware versions).

Hardware configuration - Ethernet PG/OP channel > Take IP address parameters in project

#### 4.7.1.1 Configuration via integrated CPU interface

Proceeding

From firmware version V2.4.0 this variant for configuration is recommended. The following advantages result:

- The configuration becomes clearer, because the periphery modules and the PROFINET IO devices are configured on the PROFINET line of the CPU and no additional CP is to be configured.
- There are no address collisions, because the S7 addresses for all components are assigned from the address area of the CPU.

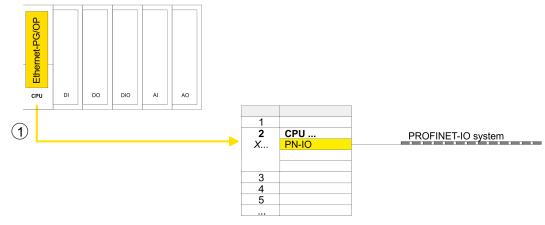

Unless during the hardware configuration of the CPU  $\Leftrightarrow$  77 there was no IP address data assigned yet or these are to be changed, the configuration happens to the following proceeding, otherwise the Ethernet PG/OP channel is configured.

- **1.** Open the Siemens hardware configurator and, if not already done, configure the Siemens CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).
- 2. Open the PROFINET Properties dialog box of the CPU by double-clicking 'PN-IO'.

**3.** Click at 'General'.

- **4.** At *'Properties'*, enter the previously assigned IP address data and a subnet. The IP address data are not accepted without subnet assignment!
- 5. Transfer your project.

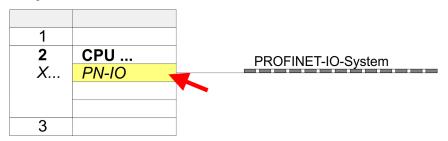

1 Ethernet PG/OP channel

#### 4.7.1.1.1 Time-of-day synchronization

## NTP method

In the NTP mode (**N**etwork **T**ime **P**rotocol) the module sends as client time-of-day queries at regular intervals to all configured NTP servers within the sub net. You can define up to 4 NTP server. Based on the response from the servers, the most reliable and most exact time-of-day is determined. Here the time with the lowest *stratum* is used. *Stratum 0* is the time standard (atomic clock). *Stratum 1* are directly linked to this NTP server. Using the NTP method, clocks can be synchronized over subnet boundaries. The configuration of the NTP servers is carried out in the Siemens SIMATIC Manager via the CP, which is already configured.

- **1.** Open the Properties dialog by double-clicking '*PN-IO*'.
- **2.** Select the tab '*Time-of-day synchronization*'.
- 3. Activate the NTP method by enabling 'Activate NTP time-of-day synchronization'.
- **4.** Click at [Add] and add the corresponding NTP server.
- **5.** Set the *'Update interval'* you want. Within this interval, the time of the module is synchronized once.
- 6. Close the dialog with [OK].
- 7. Save and transfer your project to the CPU.
  - ⇒ After transmission, the NTP time is requested by each configured time server and the best response for the time synchronization is used.

Please note that although the time zone is evaluated, an automatic changeover from winter to summer time is not supported. Industrial systems with time-of-day synchronization should always be set in accordance to the winter time.

With the FC 61 you can determine the local time in the CPU. More information about the usage of this block may be found in the manual "SPEED7 Operation List".

#### 4.7.1.2 Configuration via additional CP

#### Proceeding

This is the conventional variant for configuration and is supported by all firmware versions. If possible, always use the configuration via the internal interface, otherwise the following disadvantages result:

- Address overlaps are not recognized in the Siemens SIMATIC Manager.
- For PROFINET devices only the address range 0 ... 1023 is available.
- The addresses of the PROFINET devices are not checked with the address range of the CPU by the Siemens SIMATIC Manager for address overlaps.

Hardware configuration - Ethernet PG/OP channel > Take IP address parameters in project

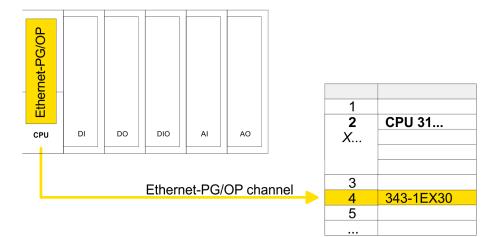

The configuration happens according to the following procedure:

- **1.** Open the Siemens hardware configurator and, if not already done, configure the Siemens CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).
- 2. Place for the Ethernet PG/OP channel at slot 4 the Siemens CP 343-1 (SIMATIC 300 \ CP 300 \ Industrial Ethernet \CP 343-1 \ 6GK7 343-1EX30 0XE0 V3.0).

## CAUTION!

Please configure the diagnostic addresses of the CP343-1EX30 for '*PN-IO*', '*Port1*' and '*Port2*' so that no overlaps occur in the periphery input area. Otherwise your CPU can not start-up and you receive the diagnostic entry 0xE904. These addresses overlaps are not recognized by the Siemens SIMATIC Manager.

- 3. Open the Properties dialog by double-clicking on *'PN-IO'* of the CP 343-1EX30 and enter the previously assigned IP address data and a subnet for the CP at *'Properties'*. The IP address data are not accepted without subnet assignment!
- **4.** Transfer your project.

1 Ethernet PG/OP channel

#### 4.7.1.2.1 Time-of-day synchronization

#### **NTP** method

In the NTP mode (**N**etwork **T**ime **P**rotocol) the module sends as client time-of-day queries at regular intervals to all configured NTP servers within the sub net. You can define up to 4 NTP server. Based on the response from the servers, the most reliable and most exact time-of-day is determined. Here the time with the lowest *stratum* is used. *Stratum 0* is the time standard (atomic clock). *Stratum 1* are directly linked to this NTP server. Using the NTP method, clocks can be synchronized over subnet boundaries. The configuration of the NTP servers is carried out in the Siemens SIMATIC Manager via the CP, which is already configured.

1	
<b>2</b> X	CPU 31
Х	
3	
4	343-1EX30
5	

- **1.** Open the properties dialog via double-click on the CP 343-1EX30.
- 2. Select the register 'Time-of-day synchronization'.
- 3. Activate the NTP method by enabling 'Activate NTP time-of-day synchronization'.
- 4. Click at [Add] and add the corresponding NTP server.
- 5. Select your 'time zone'. In the NTP method, UTC (Universal Time Coordinated) is generally transmitted; this corresponds to GMT (Greenwich Mean Time). By configuring the local time zone, you can set a time offset to UTC.
- **6.** Select your *'Update interval'*. Within this interval the time of the module is synchronized once.
- 7. Close the dialog with [OK].
- 8. Save and transfer your project to the CPU.
  - ⇒ After transmission, the NTP time is requested by each configured time server and the best response for the time synchronization is used.

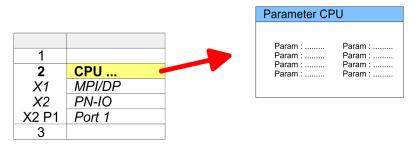

Please note that although the time zone is evaluated, an automatic changeover from winter to summer time is not supported. Industrial systems with time-of-day synchronization should always be set in accordance to the winter time.

With the FC 61 you can determine the local time in the CPU. More information about the usage of this block may be found in the manual "SPEED7 Operation List". Setting standard CPU parameters > Parameter CPU

# 4.8 Setting standard CPU parameters

## 4.8.1 Parameterization via Siemens CPU

Parameterization via Siemens CPU 314C-2 PN/DP Since the CPU is to be configured as Siemens CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3) in the Siemens hardware configurator, the standard parameters of the CPU may be set with "Object properties" of the CPU 314C-2 PN/DP during hardware configuration. Via a double-click on the CPU 314C-2 PN/DP the parameter window of the CPU may be accessed. Using the registers you get access to every standard parameter of the CPU.

## 4.8.2 Parameter CPU

## Supported parameters

The CPU does not evaluate each parameter, which may be set at the hardware configuration. The parameters of the following registers are not supported: Synchronous cycle interrupts, communication and web. The following parameters are currently supported:

General

- Short description
  - The short description of the Siemens CPU is CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).
- Order No. / Firmware
  - Order number and firmware are identical to the details in the "hardware catalog" window.
- Name
  - The Name field provides the short description of the CPU.
  - If you change the name the new name appears in the Siemens SIMATIC Manager.
- Plant designation
  - Here is the possibility to specify a plant designation for the CPU.
  - This plant designation identifies parts of the plant according to their function.
  - Its structure is hierarchic according to IEC 81346-1.
- Location designation
  - The location designation is part of the resource designation.
  - Here the exact location of your module within a plant may be specified.
- Comment
  - In this field information about the module may be entered.

_		
Startup		Startup when expected/actual configuration differs
		- If the checkbox for 'Startup when expected/actual configuration differ' is dese-
		lected and at least one module is not located at its configured slot or if another
		type of module is inserted there instead, then the CPU does not switch to RUN mode and remains in STOP mode.
		- If the checkbox for 'Startup when expected/actual configuration differ' is selected,
		then the CPU starts even if there are modules not located in their configured slots
		of if another type of module is inserted there instead, such as during an initial
	_	system start-up.
		Monitoring time for ready message by modules [100ms]
		<ul> <li>This operation specifies the maximum time for the ready message of every con- figured module after PowerON.</li> </ul>
		<ul> <li>Here connected PROFIBUS DP slaves are also considered until they are parame- terized.</li> </ul>
		- If the modules do not send a ready message to the CPU by the time the moni-
		toring time has expired, the actual configuration becomes unequal to the preset configuration.
		Monitoring time for transfer of parameters to modules [100ms]
		- The maximum time for the transfer of parameters to parameterizable modules.
		<ul> <li>Here connected PROFINET IO devices also considered until they are parameter- ized.</li> </ul>
		<ul> <li>If not every module has been assigned parameters by the time this monitoring time has expired; the actual configuration becomes unequal to the preset configu-</li> </ul>
		ration.
Cycle / Clock memory		Update OB1 process image cyclically
		<ul> <li>This parameter is not relevant.</li> </ul>
		Scan cycle monitoring time
		<ul> <li>Here the scan cycle monitoring time in milliseconds may be set.</li> </ul>
		<ul> <li>If the scan cycle time exceeds the scan cycle monitoring time, the CPU enters the STOP mode.</li> </ul>
		<ul> <li>Possible reasons for exceeding the time are:</li> </ul>
		- Communication processes
		- a series of interrupt events
		- an error in the CPU program
		Minimum scan cycle time
		<ul> <li>This parameter is not relevant.</li> </ul>
		Scan cycle load from Communication
		<ul> <li>Using this parameter you can control the duration of communication processes, which always extend the scan cycle time so it does not exceed a specified length.</li> </ul>
		- If the cycle load from communication is set to 50%, the scan cycle time of OB 1
		can be doubled. At the same time, the scan cycle time of OB 1 is still being influ- enced by asynchronous events (e.g. hardware interrupts) as well.
		Size of the process image input/output area
	_	<ul> <li>Here the size of the process image max. 2048 for the input/output periphery may</li> </ul>
		be fixed (default: 256).
		OB85 call up at I/O access error
		<ul> <li>The preset reaction of the CPU may be changed to an I/O access error that occurs during the update of the process image by the system.</li> </ul>
		- The CPU is preset such that OB 85 is not called if an I/O access error occurs and

- no entry is made in the diagnostic buffer either.
- Clock memory
  - Activate the check box if you want to use clock memory and enter the number of the memory byte.

Setting standard CPU parameters > Parameter CPU

	<ul> <li>The selected memory byte cannot be used for temporary data storage.</li> <li>1</li> </ul>
Retentive Memory	<ul> <li>Number of Memory bytes from MB0 <ul> <li>Enter the number of retentive memory bytes from memory byte 0 onwards.</li> </ul> </li> <li>Number of S7 Timers from T0 <ul> <li>Enter the number of retentive S7 timers from T0 onwards. Each S7 timer occupies 2bytes.</li> </ul> </li> <li>Number of S7 Counters from C0 <ul> <li>Enter the number of retentive S7 counter from C0 onwards.</li> </ul> </li> <li>Areas <ul> <li>This parameter is not supported.</li> </ul> </li> </ul>
Interrupts	<ul> <li>Priority</li> <li>Here the priorities are displayed, according to which the hardware interrupt OBs are processed (hardware interrupt, time-delay interrupt, async. error interrupts).</li> </ul>
Time-of-day interrupts	<ul> <li>Priority <ul> <li>This value is fixed to 2.</li> </ul> </li> <li>Active <ul> <li>By enabling 'Active' the time-of-day interrupt function is enabled.</li> </ul> </li> <li>Execution <ul> <li>Select how often the interrupts are to be triggered.</li> <li>Intervals ranging from every minute to yearly are available. The intervals apply to the settings made for <i>start date</i> and <i>time</i>.</li> </ul> </li> <li>Start date/time <ul> <li>Enter date and time of the first execution of the time-of-day interrupt.</li> </ul> </li> <li>Process image partition <ul> <li>This parameter is not supported.</li> </ul> </li> </ul>

4.8.3 Parameter for MP	I/DP The properties dialog of the MPI(PtP) interface X3 is opened via a double click to the sub module MPI/DP

Enable bus functionality via VS	SC
---------------------------------	----

To switch the interface X3 MPI(PtP) to PROFIBUS functionality you have to activate the according bus functionality by means of a Yaskawa VSC storage media. By plugging the VSC storage card and then an overall reset the according functionality is activated. Schap. 4.16 'Deployment storage media - VSD, VSC' page 119

General

- Short description
  - Here the short description "MPI/DP" for the interface is specified.
- Name
  - At Name "MPI/DP" is shown. If you change the name, the new name appears in the Siemens SIMATIC Manager.
- Туре
  - Here you can choose between the functionalities MPI and PROFIBUS.
- Interface
  - Here the MPI respectively PROFIBUS address is shown.

Setting product specific CPU parameters

- Properties
  - With this button the properties of the interface may be pre-set.
- Comment
  - You can enter the purpose of the interface.

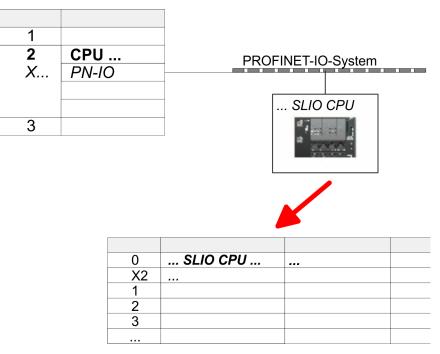

Address

- Diagnostics
  - A diagnostics address for the interface is to be pre-set here. In the case of an error the CPU is informed via this address.
- Operating mode
  - With the interface type 'PROFIBUS' here you can pre-set the 'Operating mode' DP Slave.
- Configuration, Clock
  - These parameters are not supported.

## 4.9 Setting product specific CPU parameters

Overview

Except of the product specific CPU parameters the CPU parametrization takes place in the parameter dialog of the CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3) from Siemens. After the hardware configuration of the CPU you can set the parameters of the CPU in the virtual IO device *… SLIO CPU*<sup>'</sup>. Via double-click at the *'VIPA SLIO System'* 013-CCF0R00 CPU the properties dialog is opened.

Here the following parameters may be accessed:

Diagnostic

- Diagnostic interrupt in case of short circuit or overload of the power supplies

- MPI function X3
  - Functionality of X3
- Retentive data
  - Additional retentive memory, timer respectively counter
- OB
  - Priority OB 57
  - Call OB 80 on cyclic interrupt

Setting product specific CPU parameters

- Miscellaneous
  - Direct DX transition
  - PN MultipleWrite
  - − Free Module Mapping ♦ 93
  - Reduced PDU size
  - Access settings 🔄 98
  - CPU

- Activation of interfaces and ports
- Activation of protocols

#### Parameter

The following parameters may be accessed by means of the properties dialog of the CPU.

Diagnostics interrupt (default: deactivated)

- Diagnostics interrupt 5L+ (DC 24V DI power section supply)
- Diagnostics interrupt 2L+ (DC 24V DO power section supply)
- Diagnostics interrupt 3L+ (DC 24V System SLIO bus power section supply)
- Diagnostics interrupt DO short circuit/overload
- Diagnostics interrupt sensor short circuit/overload

#### MPI

Function X3

Functionality of the MPI(PtP) interface X3

- MPI/DP (default): In this operating mode parameters are active, which you set on sub module 'MPI/DP' of the Siemens CPU 314C-2 PN/DP. Schap. 11 'Option: Deployment PROFIBUS communication' page 262
- PTP: With this operating mode the RS485 interface acts as an interface for serial point-to-point communication. Here data may be exchanged between two stations by means of protocols. Schap. 6 'Deployment PtP communication' page 178

#### Retentive data

- Additional retentive memory
  - Here enter the number of retentive memory bytes. With 0 the value *Retentive memory* → *Number of memory bytes starting with MB0*' is set, which is pre-set at the parameters of the Siemens CPU.
  - Range of values: 0 (default) ... 8192
- Additional retentive timer
  - Enter the number of S7 timers. With 0 the value 'Retentive memory
    - → Number S7 timers starting with T0' is set, which is pre-set at the parameters of the Siemens CPU.
  - Range of values: 0 (default) ... 512
- Additional retentive counter
  - Enter the number of S7 counter. With 0 the value 'Retentive memory
  - → Number S7 counters starting with C0' is set, which is pre-set at the parameters of the Siemens CPU.
  - Range of values: 0 (default) ... 512

#### OB

- Priority OB 57
  - Here you can set the priority for the OB 57.
  - Range of values: 2 (default) ... 24
- OB 80 for cyclic interrupt error
  - Here you can set for which cyclic interrupt OB 80 (time error) should be called.
  - Range of values: Deactivated (default), selection of the corresponding OB

#### Miscellaneous

- Direct DX transition if this parameter is activated, the integrated PROFIBUS DP master, if activated by VSC, shows the following behavior:
  - As long as a DP slave is in Data Exchange, i.e. in the DP slave standard diagnostic data byte 0, bit 1 and byte 1, bit 0 have the status 0, this DP slave is directly taken from the DP master in Data Exchange. The transition happens without a SetPrm- and CheckConfig telegram was being sent to the DP Slave.
  - When a DP slave is taken to Data Exchange, the outputs remain active and are not deactivated.
  - If the CPU goes from RUN to STOP, the DP master is deactivated for at least the duration of the *Response monitoring time*, which is to be set in the PROFIBUS parameters. Afterwards, the DP master becomes active again and takes the DP slaves back to Data Exchange. When the DP master transitions to the inactive state, the output data of the DP slaves are not zeroed nor deactivated. Standard-compliant DP slaves automatically will switch off the outputs or zero them if they do not receive DE telegrams from the master during the *Response monitoring time*.
  - If the power supply of the CPU fails, the outputs of the DP slaves are not zeroed and not deactivated. Standard-compliant DP slaves automatically will switch off the outputs or zero them if they do not receive DE telegrams from the master during the *Response monitoring time*.
- PN MultipleWrite
  - In the activated state, parameter record sets are combined at PROFINET to one or more Ethernet frames during the connection setup. This speeds up the connection setup, since a separate Ethernet frame is not used for each parameter record set.
- Free Module Mapping 😔 93
  - When activated, you can use your CPU in different hardware variants.
  - You specify the mapping at runtime with record set 0x7F.
- Reduced PDU size
  - When activated, the PDU size is reduced accordingly.
  - For some protocols, some configuration tools require a reduced PDU size. For example, in the Siemens TIA portal for variable forcing, the PDU size must be reduced. For the processing of single steps at several breakpoints, the PDU size must also be reduced.

Access settings 🖏 98

- When activated, you have access to the interface or the corresponding communication protocol.
- By default, there is no access restriction.

## 4.9.1 Free Module Mapping

4.9.1.1 Overview

Free module mapping - FMM

With FMM you can use your CPU in different hardware variants without adapting your user program. You only have to adapt the FMM configuration in the CPU when configuring the hardware variants. Here you have the following possibilities:

- Modules from the target configuration can be divided in any order to the slots of the actual configuration.
- Modules from the target configuration may be missing in the actual configuration.
- Individual slots of the target configuration can be deactivated, on which modules are located in the actual configuration.
- FMM is a functionality of Yaskawa and is only supported by Yaskawa modules.
- By default, FMM is disabled. To use FMM mapping, you must enable the CPU parameter 'Free Module Mapping'.
- For the *FMM* the mapping of the slots is to be specified via the record set 0x7F.
- For commissioning, you have to enable the parameter 'Startup when expected/actual configuration differs' in your CPU.
- If FMM is activated and configured correctly, the system reacts as follows:
  - During start-up, no target/actual difference of the hardware is diagnosed.
  - Output data of missing modules are ignored and not output.
  - Input data of missing modules are set to 0.

#### 4.9.1.2 FMM configuration

Configuration

- The mapping of the modules is defined as configuration by the 64byte record set 0x7F.
- The data record is retentively stored in the CPU.
- The record set must be transferred to the CPU by the user program by means of a write command.
- With the record set read command parts of the active configuration can be read. You have always to write the complete record set.
- Each written and valid configuration is only saved if a difference to the existing configuration exists.

#### Record set 0x7F

Necolu Sel					
Byte	0	1	2	3	 63
Mapping					

- The record 0x7F has a length of 64Byte, where Byte 0 ... 63 corresponds to the slot 1 ... 64 of the target configuration.
- For the FMM configuration, you must specify for each used slot of the target configuration at 'Mapping' the corresponding value that corresponds to the actual configuration.

The following values can be entered at Mapping:

- 0 (0x00) module is ignored
  - If modules of the target configuration are to be ignored, the value 0x00 must be used. In this way, gaps can be projected.
- 1 ... 64 (0x01 ... 0x40) position of the module in the actual configuration
  - *'Mapping'* corresponds to the value of Slot<sub>actual</sub> i.e. the slot of the actual configuration on which the module of the target configuration is located.
- 255 (0xFF) virtual module
  - If a module from the target configuration is missing, for Mapping the value 255 for "virtual module" is to be used.
  - Behaviour of a *virtual module*:
    - The input area always has the value 0, regardless of its size.
    - The writing to the output area has no effect.

#### Commissioning

The *target configuration* serves as template for the configuration of hardware variants.

- **1.** Configure your system with a hardware configuration as target configuration and create your user program. The target configuration represents a superset of all available hardware variants.
- **2.** Activate the parameter '*Free Module Mapping*' in your CPU.
- **3.** Activate the parameter 'Startup when expected/actual configuration differs' in your CPU.
- **4.** Create the configuration by defining the deviation of the actual and target configuration for the current hardware configuration in record set 0x7F.
- 5.

Transfer this record set via write command to your CPU.

- For this use SFB 53 or SFB 58.
- The address to be used is the diagnostic address of the CPU in the virtual IO device '... SLIO CPU'.
- ⇒ The configuration is permanently stored in the CPU and immediately active.

#### 4.9.1.3 Examples

(1): Tar	get c	onfig	jurati	on			Slot <sub>target</sub>
Slot:	1	2	3	4	5	6	1
							2
$\bigcirc$	DI	DO	DIO	AI	AO	CP	3
				_			4
							5
							6

Slot<sub>target</sub> - The mapping always refers to the slot of the target configuration.

Based on the target configuration, the following examples show how to determine the mapping values for the hardware variants.

#### 4.9.1.3.1 Examples of hardware variants

#### Variant 1: Same type and number of modules but reversed slots

(1): Ta	rget o	confi	gurat	ion			Slot <sub>target</sub>	Slot <sub>actual</sub>	Record se	et 0x7F
(2): Ac	tual	confi	gurat	tion					Byte	Mapping
Slot	: 1	2	3	4	5	6	1	2	0	0x02
(1)						0.0	2	1	1	0x01
	DI	DO	DIO	AI	AO	СР	3	3	2	0x03
	$\geq$	$\langle \cdot \rangle$			$\searrow$	$\langle \rangle$	4	5	3	0x05
	×	*	•	<b>*</b>		*	5	6	4	0x06
2	DO	DI	DIO	СР	AI	AO	6	4	5	0x04

Determination of Mapping values of record set 0x7F:

- Byte 0: The module of  $Slot_{target} = 1$  is in the actual configuration at  $Slot_{actual} = 2 \rightarrow Mapping = 0x02$
- Byte 1: The module of  $Slot_{target} = 2$  is in the actual configuration at  $Slot_{actual} = 1 \rightarrow Mapping = 0x01$
- Byte 2: The module of  $Slot_{target}$  = 3 is in the actual configuration at  $Slot_{actual}$  = 3  $\rightarrow$  Mapping = 0x03
- Byte 3: The module of  $Slot_{target} = 4$  is in the actual configuration at  $Slot_{actual} = 5 \rightarrow Mapping = 0x05$
- Byte 4: The module of  $Slot_{target} = 5$  is in the actual configuration at  $Slot_{actual} = 6 \rightarrow Mapping = 0x06$
- Byte 5: The module of  $Slot_{target} = 6$  is in the actual configuration at  $Slot_{actual} = 4 \rightarrow Mapping = 0x04$

Slot<sub>target</sub> - The mapping always refers to the slot of the target configuration.

- Slot<sub>actual</sub> Slot of the actual configuration on which the module of the target configuration is located.
- Mapping For variant 1, *Mapping* corresponds to *Slot<sub>actual</sub>*, i.e. slot of the actual configuration on which the module of the target configuration is located.

(1): Tar	get	config	gurat	ion			Slot <sub>target</sub>	Slot <sub>actual</sub>	Record se	et 0x7F
(2): Ac	tual	confi	gurat	ion					Byte	Mapping
Slot:	1	2	3	4	5	6	1	1	0	0x01
(1)							2	-	1	0xFF
	DI	DO X	DIO	AI	AO	CP X	3	2	2	0x02
			/ /		/		4	3	3	0x03
	*	*	*	*			5	4	4	0x04
2	DI	DIO	AI	AO			6	-	5	0xFF

Determination of *Mapping* values of record set 0x7F:

Byte 0: The module of  $Slot_{target} = 1$  is in the actual configuration at  $Slot_{actual} = 1 \rightarrow Mapping = 0x01$ 

Byte 1: The module of  $Slot_{target}$  = 2 is not available in the actual configuration  $\rightarrow$  Mapping = 0xFF

- Byte 2: The module of  $Slot_{target}$  = 3 is in the actual configuration at  $Slot_{actual}$  = 2  $\rightarrow$  Mapping = 0x02
- Byte 3: The module of  $Slot_{target}$  = 4 is in the actual configuration at  $Slot_{actual}$  = 3  $\rightarrow$  Mapping = 0x03
- Byte 4: The module of  $Slot_{target} = 5$  is in the actual configuration at  $Slot_{actual} = 4 \rightarrow Mapping = 0x04$
- Byte 5: The module of  $Slot_{target}$  = 6 is not available in the actual configuration  $\rightarrow$  Mapping = 0xFF

Slot<sub>target</sub> - The mapping always refers to the slot of the target configuration.

- Slot<sub>actual</sub> Slot of the actual configuration on which the module of the target configuration is located.
- Mapping For variant 2, *Mapping* corresponds to the value of *Slot<sub>actual</sub>*, i.e. slot of the actual configuration on which the module of the target configuration is located. If a module from the target configuration is missing, for *Mapping* the value 0xFF for "virtual module" is to be used.

(1): Ta	rget o	confi	gurat	ion			Slot <sub>target</sub>	Slot <sub>actual</sub>	Record se	et 0x7F
(2): Ac	tual	confi	gurat	tion					Byte	Mapping
Slot	: 1	2	3	4	5	6	1	empty	0	0x00
(1)							2	empty	1	0x00
	DI	DO	DIO	AI	AO	СР	3	3	2	0x03
							4	4	3	0x04
-	•	•	•	•	•	•	5	5	4	0x05
2	DI	DO	DIO	AI	AO	СР	6	6	5	0x06

#### Variant 3: Modules are ignored

Determination of *Mapping* values of record set 0x7F:

- Byte 0: The module of  $Slot_{target}$  = 1 is ignored in the actual configuration  $\rightarrow$  Mapping = 0x00
- Byte 1: The module of  $Slot_{target}$  = 2 is ignored in the actual configuration  $\rightarrow$  Mapping = 0x00
- Byte 2: The module of  $Slot_{target}$  = 3 is in the actual configuration at  $Slot_{actual}$  = 3  $\rightarrow$  Mapping = 0x03
- Byte 3: The module of  $Slot_{target} = 4$  is in the actual configuration at  $Slot_{actual} = 4 \rightarrow Mapping = 0x04$
- Byte 4: The module of  $Slot_{target} = 5$  is in the actual configuration at  $Slot_{actual} = 5 \rightarrow Mapping = 0x05$
- Byte 5: The module of  $Slot_{target}$  = 6 is in the actual configuration at  $Slot_{actual}$  = 6  $\rightarrow$  Mapping = 0x06
  - Slot<sub>target</sub> The mapping always refers to the slot of the target configuration.
  - Slot<sub>actual</sub> Slot of the actual configuration on which the module of the target configuration is located.
  - Mapping For variant 3, *Mapping* corresponds to the value of *Slot<sub>actual</sub>*, i.e. slot of the actual configuration on which the module of the target configuration is located. If modules of the target configuration are to be ignored, for *Mapping* the value 0x00 is to be used.

The presence of gaps in the System SLIO is not allowed! But you can place modules and define them via the configuration as empty slot for the target hardware configuration.

Setting product specific CPU parameters > Access settings

# 4.9.2 Access settings **Overview** The 'Access setting' allows you to disable access to ports or protocols. The CPU has an integrated Device web page that shows information about the access ways via 'Access Ways'. & Chap. 4.11.1 'Device web page CPU' page 102 **Ethernet Port** Here you can disable individual Ethernet interfaces. Please note that by disabling e.g. the Ethernet PG/OP channel after transferring the hardware configuration, the CPU can no longer be configured via this Ethernet PG/OP channel. The access setting can be reset by an overall reset. Ethernet protocol Here you can disable Ethernet protocols. If a protocol is disabled, requests via the disabled protocol will be rejected. TCP/UDP/IP services

- NTP protocol protocol for time synchronization between the stations.
  - OPC UA protocol for access to an OPC UA project in the CPU.
- Open communication protocol for communication via the user program when using handling blocks.
- Device WebSite protocol for access to the integrated web server.
- Web Visu protocol for access to the Web visualization in the CPU, which can be configured accordingly.
- S7 connections
  - PG/OP protocol protocol for PG/OP communication via Siemens S7 connections.
  - PG/OP Routing routing requests via Siemens S7 connections.
  - NetPro connections protocol for communication between PLC systems based on Siemens STEP®7 by means of configured communication connections.
- Other services
  - DCP frame for determining accessible nodes on PROFINET
  - LLDP frame for determining the topology on PROFINET
  - Field bus PN Communication via PROFINET frames.

Please regard that with the deactivation of the communication via PROFINET telegrams the DCP protocol is also deactivated!

**MPI/PB** protocol via X3

Here you can disable protocols for the MPI interface X3. If a protocol is disabled, requests via the disabled protocol will be rejected.

- MPI(PB) PG/OP protocol - protocol for PG/OP communication via the MPI(PB) interface X3.
- MPI(PB) Routing routing requests via the MPI(PB) interface X3.
- Global data communication - protocol for cyclic data exchange between CPUs via the MPI interface.

# 4.10 **Project transfer** Overview There are the following possibilities for project transfer into the CPU: Transfer via MPI (optional via PROFIBUS) Transfer via Ethernet Transfer via memory card Enable bus functionality via VSC To switch the interface X3 MPI(PtP) to PROFIBUS functionality you have to activate the according bus functionality by means of a Yaskawa VSC storage media. By plugging the VSC storage card and then an overall reset the according functionality is activated. & Chap. 4.16 'Deployment storage media - VSD, VSC' page 119 4.10.1 Transfer via MPI / optional PROFIBUS General For transfer via MPI the CPU has the following interface: ♦ 'X3: MPI(PtP) interface' page 52 Net structure The structure of a MPI net is electrically identical with the structure of a PROFIBUS net. This means the same rules are valid and you use the same components for the build-up. The single participants are connected with each other via bus interface plugs and PROFIBUS cables. Per default the MPI net runs with 187.5kbaud. The CPUs are delivered with MPI address 2. MPI programming cable The MPI programming cables are available at Yaskawa in different variants. The cables provide a RS232 res. USB plug for the PC and a bus enabled RS485 plug for the CPU. Due to the RS485 connection you may plug the MPI programming cables directly to an already plugged plug on the RS485 jack. Every bus participant identifies itself at the bus with an unique address, in the course of the address 0 is reserved for programming devices. Terminating resistor A cable has to be terminated with its surge impedance. For this you switch on the terminating resistor at the first and the last participant of a network or a segment. Please make sure that the participants with the activated terminating resistors are always power supplied. Otherwise it may cause interferences on the bus. 3 1 MPI programming cable 1 2 Activate the terminating resistor via switch

3 MPI network

# Approach transfer via MPI 1. Connect your PC to the MPI jack of your CPU via a MPI programming cable.

- **2.** Load your project in the SIMATIC Manager from Siemens.
- 3. ▶ Choose in the menu 'Options → Set PG/PC interface'.
- **4.** Select in the according list the "PC Adapter (MPI)"; if appropriate you have to add it first, then click on [Properties].
- **5.** Set in the register MPI the transfer parameters of your MPI net and type a valid *address.*
- **6.** Switch to the register *Local connection*.
- **7.** Set the COM port of the PCs and the transfer rate 38400baud for the MPI programming cable.
- **8.** Transfer your project via '*PLC*  $\rightarrow$  Load to module' via MPI to the CPU and save it with '*PLC*  $\rightarrow$  Copy RAM to ROM' on a memory card if one is plugged.

# Proceeding Transfer via PROFIBUS interface

T	$\bigcirc$
tc	5
st	
re	

To switch the interface X3 MPI(PtP) to PROFIBUS functionality you have to activate the according bus functionality by means of a Yaskawa VSC storage media. By plugging the VSC storage card and then an overall reset the according functionality is activated.

- Connect your PC to the MPI(PtP) jack X3 of your CPU via a MPI programming cable.
- **2.** Load your project in the Siemens SIMATIC Manager.
- 3. ▶ Choose in the menu 'Options → Set PG/PC interface'.
- **4.** Select in the according list the "PC Adapter (PROFIBUS)"; if appropriate you have to add it first, then click at [Properties].
- 5. Set in the register PROFIBUS the transfer parameters of your PROFIBUS net and enter a valid *PROFIBUS address*. The *PROFIBUS address* must be assigned to the DP master by a project before.
- **6.** Switch to the register *Local connection*.
- **7.** Set the COM port of the PCs and the transfer rate 38400baud for the MPI programming cable.
- **8.** Transfer your project via '*PLC*  $\rightarrow$  Load to module' via PROFIBUS to the CPU and save it with '*PLC*  $\rightarrow$  Copy RAM to ROM' on a memory card if one is plugged.

Transfer via PROFIBUS is available by DP master, if projected as master and assigned with a PROFIBUS address before. In slave operation you have also to enable the option 'Test, Commissioning, Routing' when selecting the slave mode.

## 4.10.2 Transfer via Ethernet

Initialization

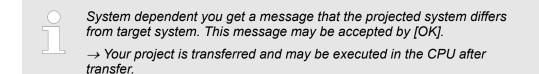

So that you may access the according Ethernet interface you have to assign IP address parameters by means of the "initialization".

- X1/X2: Ethernet PG/OP channel
  - & Chap. 4.7 'Hardware configuration Ethernet PG/OP channel' page 80

Accessing the web server

Transfer

- **1.** For the transfer, connect, if not already done, the appropriate Ethernet port to your Ethernet.
- **2.** Open your project with the Siemens SIMATIC Manager.
- 3. Set via 'Options → Set PG/PC Interface' the access path to "TCP/IP → Network card .... ".
- 4. Click to '*PLC* → *Download*' Download → the dialog "Select target module" is opened. Select your target module and enter the IP address parameters of the Ethernet PG/OP channel for connection. Provided that no new hardware configuration is transferred to the CPU, the entered Ethernet connection is permanently stored in the project as transfer channel.
- **5.** With [OK] the transfer is started.

#### 4.10.3 Transfer via memory card

**Proceeding transfer via memory card** The memory card serves as external storage medium. There may be stored several projects and sub-directories on a memory card. Please regard that your current project is stored in the root directory and has one of the following file names:

- S7PROG.WLD
- AUTOLOAD.WLD
- 1. Start the Siemens SIMATIC Manager with your project
- 2. ▶ Create with 'File → Memory Card File → New' a new wld file.
- 3. Copy the blocks from the project blocks folder and the System data into the wld file.
- **4.** Copy the wld file at a suited memory card. Plug this into your CPU and start it again.
  - ⇒ The transfer of the application program from the memory card into the CPU takes place depending on the file name after an overall reset or PowerON.

S7PROG.WLD is read from the memory card after overall reset.

AUTOLOAD.WLD is read from the memory card after PowerON.

The blinking of the SD LED of the CPU marks the active transfer. Please regard that your user memory serves for enough space for your user program, otherwise your user program is not completely loaded and the SF LED gets on.

4.11 Accessing the web server

Overview

The CPU has a web server integrated. This provides access via the Ethernet PG/OP channel to:

- Device web page of the CPU
- CPU OPC UA project
- CPU WebVisu project
- ♦ Chap. 7 'Deployment OPC UA' page 191
- & Chap. 8 'Deployment WebVisu Web visualization' page 217

## 4.11.1 Device web page CPU

### Overview

Dynamic web page, which exclusively outputs information.

- On the device web page you will find information about:
  - CPU
  - the connected modules
  - OPC UA project
  - WebVisu project
- The shown values cannot be changed.
- Access is via the IP address of the Ethernet PG/OP channel.
  - & Chap. 4.7 'Hardware configuration Ethernet PG/OP channel' page 80
- You can access the IP address with a web browser.

Tab:	'IP'	Here the IP address data of your Ethernet PG/OP channel are shown.
Tab:	'Firmware'	As of CPU firmware version V3.0.0, you can transfer the firmware file online to the CPU via the <i>'Firmware'</i> tab. The firmware update in the CPU is triggered by means of the operating mode switch. $\bigotimes$ Chap. 4.14 <i>'Firmware update'</i> page 114
Tab:	'Access Ways'	As of CPU firmware version V3.0.0, information about access settings is shown here. In the delivery state, there are no restrictions. You can specify access to interfaces, ports and protocols via the parametrization. <i>S Chap. 4.9 Setting product specific CPU parameters' page 90</i>

## 4.11.1.1.1 Tab: 'OPC UA'

As of CPU firmware version V3.0.0, information about the OPC UA project is shown here. S Chap. 7 'Deployment OPC UA' page 191

• Device	Info CPU	OPC UA
	Start Conditions	
	Conflicting projects Feature Set activated Allowed by User Allowed by Access Ways Hardware configured OPC UA project	no conflicting project on card yes yes yes loaded
	Server	
	State Endpoint URL	running opc tcp://190.165.72.180:4840

#### **Start Conditions**

Here the start conditions for the OPC UA server are listed:

- Conflicting projects
  - Simultaneous use of an OPC UA and WebVisu project via the same interface is not permitted and results in the message 'conflicting project on card'.
  - The status 'no conflicting project on card' indicates that there is no conflict with a WebVisu project on the same interface.
- Feature Set activated
  - yes: The OPC UA functionality is activated.
  - no: The OPC UA functionality is not activated.
  - & Chap. 7.3 'Activate OPC UA functionality' page 200
- Allowed by User
  - yes: The OPC UA server is activated and access to it is allowed. As soon as an OPC UA project is found on the memory card, it is automatically started and enabled for access.
  - no: You can disable and stop the OPC UA server by means of the CMD auto command 'OPCUA\_PGOP\_DISABLE'. With 'OPCUA\_PGOP\_ENABLE' you can enable to restart the OPC UA server.
  - 🖔 Chap. 4.18 'CMD auto commands' page 122
- Allowed by Access Ways
  - yes: By default, the OPC UA protocol is enabled.
  - no: The OPC UA protocol is disabled. You can deactivate or activate the OPC UA protocol by means of the parameter 'OPC UA' in the 'Access settings'.
- Hardware configured
  - yes: A hardware configuration as a precondition for the OPC UA communication is loaded. The hardware configuration is checked for validity elsewhere.
  - no: A hardware configuration is not loaded e.g. after an overall reset.
  - 🤄 Chap. 4.5 'Hardware configuration CPU' page 77
- OPC UA project
  - loaded: An OPC UAOPC UA project is loaded.
  - not loaded: An OPC UAOPC UA project is not loaded.
  - ♦ Chap. 7 'Deployment OPC UA' page 191

#### Server

- Running: The start conditions are fulfilled and the OPC UA server is started.
- Stopped: The OPC UA server is stopped.
- Startup failure: The OPC UA server can not be started.
- Starting: The OPC UA server currently starts up.
- Stopping: The OPC UA server currently stopps.
- Endpoint URL

State

 As soon as the OPC UA server is started, the endpoint URL of the OPC UA server is listed here.

### 4.11.1.1.2 Tab: 'WebVisu'

Information about the web visualization (*'WebVisu'*) are shown here. The creation of a *'WebVisu'* project is only possible with the *SPEED7 Studio* V1.7.0 and up. *Chap. 8 'Deployment WebVisu - Web visualization'* page 217

• Device	Info	WebVis	u	
	General Information Feature Status User authentication	activated running not activated		
	Statistics Sessions Subscribed items Website Project	free 4 - 1.76 MByte	used 0 0 8.24 MByte	max 4 - 10.00 MByte
	<b>Link</b> Wevisu via HTTP Webvisu via HTTPS	http://192.168 https://192.16		

For your CPU can process a WebVisu project, you have to activate the WebVisu functionality. & Chap. 8.2 'Activate WebVisu functionality'

General Information	<ul> <li>Feature <ul> <li>activated: The WebVisu functionality is activated.</li> <li>not activated: The WebVisu functionality is not activated.</li> </ul> </li> <li>Status <ul> <li>The status of your WebVisu project is shown here. </li> <li>Chap. 4.11.1.1.2.1 'Status of the WebVisu' page 108</li> </ul> </li> <li>User authentication <ul> <li>activated: User authentication is activated. Access to the WebVisu happens via a login by user name and password.</li> <li>not activated: User authentication is de-activated. Access to the WebVisu is unsecured.</li> </ul> </li> </ul>
Statistics	<ul> <li>Statistical information about your WebVisu project are shown here.</li> <li>Sessions: Number of sessions, i.e. online connections to this WebVisu project. A session corresponds to an open window or tab in a web browser.</li> <li>free: Number of sessions still possible.</li> <li>used: Number of active sessions. For the number of active sessions, it is not relevant whether the sessions were started by the same or different users.</li> <li>max.: Number of sessions still possible. The maximum number of sessions is device specific and specified in the technical data.</li> <li>Subscribed items: Number of variables.</li> <li>free: Here nothing is shown.</li> <li>used: Number of variables used.</li> <li>max.: Here nothing is shown.</li> <li>WebVisu Project: Information on the memory allocation for the WebVisu project.</li> <li>free: Still free space for the WebVisu project.</li> <li>used: Size of the current WebVisu project.</li> <li>max.: Maximum available space for a WebVisu project.</li> </ul>
Link	In Status 'running' the links to access your WebVisu are listed here.

#### Status of the WebVisu

On the device web page at the tab 'WebVisu' via 'Status' you get the status of your WebVisu project.

Status	Meaning
running	WebVisu is active / has started-up and can be opened
loading webvisu project	Loading WebVisu project
shutting down	WebVisu server shuts down
stop requested	WebVisu STOP requested
stopped	WebVisu server is down
webvisu feature not activated	WebVisu not activated, memory card is not inserted
webvisu is disabled by the user	WebVisu was disabled by the user
no webvisu project file found	No WebVisu project found
no hardware configuration loaded	No hardware configuration is loaded
invalid configuration	Invalid WebVisu configuration
internal error: filesystem	Error initializing the file system
webvisu project file too large	Error loading WebVisu project, project file too large
loading webvisu project file	Error loading WebVisu project, project file may be damaged
deleting webvisu project	Failed to delete the WebVisu project
internal error: file system - delete	WebVisu project to be deleted was not found in the memory
CRC mismatch	CRC of the WebVisu project file is not correct
webvisu stopped	WebVisu server has terminated unexpectedly
internal error 1	Internal error - initialization failed step 1
internal error 2	Internal error - initialization failed step 2
internal error 3	Unexpected internal error
unknown error	General error

4.11.1.1.3	Tab: 'Port Mirro	pring'
Overview		Port Mirroring offers the possibility to diagnose the communication without additional hardware effort.
		The Ethernet PG/OP interface is designed as switch.
		When Port Mirroring of the PG/OP2: X2 (Mirror Port) interface is activated, all tele- grams received and sent via the PG/OP1: X1 interface are mirrored to the PG/OP2: X2 interface and vice versa.
		When Port Mirroring is activated, for diagnostics with diagnostics software such as Wireshark, you can connect your PC directly to the 2. interface.
		The next power-cycle will automatically disable Port Mirroring.
Enable Port	Mirroring	When enabled, you can set the parameters for <i>Port Mirroring</i> .

Accessing the web server > Device web page CPU

PG/OP1: X1	When enabled the frames of PG/OP2: X2 are mirrored to PG/OP1: X1.
PG/OP2: X2	When enabled the frames of PG/OP1: X1 are mirrored to PG/OP2: X2.
<i>Disable communication on the Mirror Port</i>	When enabled additional communication via the mirrored interface (Mirror Port) is pre- vented.
Save	With <i>Save</i> , the setting are taken and activated. The next power-cycle will automatically disable <i>Port Mirroring</i> .

### 4.11.1.2 Web page with selected module

Structure

The web page is built dynamically and depends on the number of modules, which are connected to the CPU. The web page only shows information. The shown values cannot be changed

Please consider the System SLIO power and clamp modules do not have any module ID. These may not be recognized by the CPU and so are not listed and considered during slot allocation.

Operating modes > Overview

### 4.12 Operating modes

#### 4.12.1 Overview

The CPU can be in one of 4 operating modes:

- Operating mode STOP
- Operating mode START-UP
  - (OB 100 restart / OB 102 cold start \*)
- Operating mode RUN
- Operating mode HOLD

Certain conditions in the operating modes START-UP and RUN require a specific reaction from the system program. In this case the application interface is often provided by a call to an organization block that was included specifically for this event.

**Operating mode STOP** The application program is not processed.

- If there has been a processing before, the values of counters, timers, flags and the process image are retained during the transition to the STOP mode.
- Command output disable (BASP) is activated this means the all digital outputs are disabled.
- RUN-LED off
- STOP-LED on

**Operating mode START- During the transition from STOP to RUN a call is issued to the start-up organization block OB 100.** 

- The processing time for this OB is not monitored.
- The START-UP OB may issue calls to other blocks.
- All digital outputs are disabled during the START-UP, this means BASP is activated.
- RUN LED
  - The RUN LED blinks as soon as the OB 100 is operated and for at least 3s, even if the start-up time is shorter or the CPU gets to STOP due to an error.
  - This indicates the start-up.
- STOP LED
- During the processing of the OB 100 the STOP LED is on and then turns off.
- When the CPU has completed the START-UP OB, it assumes the operating mode RUN.

\* OB 102 (Cold start)

If there is a "Watchdog" error the CPU still remains in STOP state. With such an error the CPU must be manually started again. For this the OB 102 (cold start) must exist. The CPU will not go to RUN without the OB 102. Alternatively you can bring your CPU in RUN state again by an overall reset respectively by reloading your project.

Please consider that the OB 102 (cold start) may exclusively be used for treatment of a watchdog error.

**Operating mode RUN** 

- The application program in OB 1 is processed in a cycle. Under the control of alarms other program sections can be included in the cycle.
  - All timers and counters being started by the program are active and the process image is updated with every cycle.
  - BASP is deactivated, i.e. all outputs are enabled.
  - RUN-LED on
  - STOP-LED off

Operating mode HOLD	The CPU offers up to 3 breakpoints to be defined for program diagnosis. Setting and deletion of breakpoints happens in your programming environment. As soon as a breakpoint is reached, you may process your program step by step.
Precondition	<ul> <li>For the usage of breakpoints, the following preconditions have to be fulfilled:</li> <li>Testing in single step mode is possible with STL. If necessary switch the view via <i>'View → STL'</i> to STL.</li> <li>The block must be opened online and must not be protected.</li> </ul>
Approach for working with breakpoints	<ol> <li>Activate 'View → Breakpoint Bar'.</li> <li>Set the cursor to the command line where you want to insert a breakpoint.</li> <li>Set the breakpoint with 'Debug → Set Breakpoint'.</li> <li>The according command line is marked with a circle.</li> <li>To activate the breakpoint click on 'Debug → Breakpoints Active'.</li> <li>The circle is changed to a filled circle.</li> <li>Bring your CPU into RUN.</li> <li>When the program reaches the breakpoint, your CPU switches to the state HOLD, the breakpoint is marked with an arrow and the register contents are monitored.</li> <li>Now you may execute the program code step by step via 'Debug → Execute Next Statement' or run the program until the next breakpoint via 'Debug → Resume'.</li> <li>Delete (all) breakpoints with the option 'Debug → Delete All Breakpoints'.</li> </ol>
<i>Behavior in operating state HOLD</i>	<ul> <li>The RUN-LED blinks and the STOP-LED is on.</li> <li>The execution of the code is stopped. No level is further executed.</li> <li>All times are frozen.</li> <li>The real-time clock runs is just running.</li> <li>The outputs were disabled (BASP is activated).</li> <li>Configured CP connections remain exist.</li> </ul>

The usage of breakpoints is always possible. Switching to the operating mode test operation is not necessary.

With more than 2 breakpoints, a single step execution is not possible.

Operating modes > Function security

#### 4.12.2 Function security

The CPUs include security mechanisms like a Watchdog (100ms) and a parameterizable cycle time surveillance (parameterizable min. 1ms) that stop res. execute a RESET at the CPU in case of an error and set it into a defined STOP state. The CPUs are developed function secure and have the following system properties:

Event	concerns	Effect
$RUN \rightarrow STOP$	general	BASP ( <b>B</b> efehls- <b>A</b> usgabe- <b>Sp</b> erre, i.e. command output disable) is set.
	central digital outputs	The outputs are disabled.
	central analog outputs	The outputs are disabled.
		<ul> <li>Voltage outputs issue 0V</li> <li>Current outputs 020mA issue 0mA</li> <li>Current outputs 420mA issue 4mA</li> </ul>
		If configured also substitute values may be issued.
	decentral outputs	Same behaviour as the central digital/analog outputs.
	decentral inputs	The inputs are cyclically be read by the decentralized station and the recent values are put at disposal.
$\begin{array}{l} STOP \rightarrow RUN \text{ res. PowerON} \\ \end{array}$	general	First the PII is deleted, then OB 100 is called. After the execution of the OB, the BASP is reset and the cycle starts with:
		Delete PIO $\rightarrow$ Read PII $\rightarrow$ OB 1.
	decentral inputs	The inputs are be read by the decentralized station and the recent values are put at disposal.
RUN	general	The program is cyclically executed:
		Read PII $\rightarrow$ OB 1 $\rightarrow$ Write PIO.

PII = Process image inputs

PIO = Process image outputs

Overall reset

#### 4.13 **Overall reset** Overview During the overall reset the entire user memory is erased. Data located in the memory card is not affected. You have 2 options to initiate an overall reset: Overall reset by means of the operating mode switch Overall reset by means of a configuration tool like e.g. the Siemens SIMATIC Manager You should always establish an overall reset to your CPU before loading an application program into your CPU to ensure that all blocks have been cleared from the CPU. Overall reset by means of Proceeding the operating mode switch RUN 1. Your CPU must be in STOP mode. For this switch the operating mode switch of the CPU to STOP. STOP ⇒ The ST LED is on. MR RUN 2. Switch the operating mode switch to MR position for about 3 seconds. STOP ⇒ The ST LED changes from blinking to permanently on. MR RUN RUN 3. Place the operating mode switch in the position STOP and switch it to MR and quickly back to STOP within a period of less than 3 seconds. STOP STOP ⇒ The overall reset is carried out. Here the ST LED flashes. MR MR **4.** The overall reset has been completed when the ST LED is permanently on. For the following proceeding you must be online connected to your CPU. Overall reset by means of the Siemens SIMATIC 1. For an overall reset the CPU must be switched to STOP state. You may place the Manager CPU in STOP by the menu command 'PLC → Operating mode'. You may request the overall reset by means of the menu command 'PLC 2. → Clean/Reset'. ⇒ A dialog window opens. Here you can bring your CPU in STOP state, if not already done, and start the overall reset. During the overall reset procedure the ST LED flashes. When the ST LED is on permanently the overall reset procedure has been completed. Activating functionality by If there is a VSC of Yaskawa plugged, after an overall reset the according functionality is automatically activated. 🔄 VSD page 119 S Chap. 4.16 Deployment storage media means of a VSC VSD, VSC' page 119 Automatic reload If there is a project S7PROG.WLD on the memory card, after an overall reset the CPU attempts to reload this project from the memory card. $\rightarrow$ The SD LED is on. When the reload has been completed the LED expires. The operating mode of the CPU will be STOP respectively RUN, depending on the position of the operating mode switch. The Reset to factory setting deletes completely the internal RAM of the CPU and resets Reset to factory setting

this to delivery state. Please regard that the MPI address is also set back to default 2!

& Chap. 4.15 'Reset to factory settings' page 118

Firmware update

### 4.14 Firmware update

Overview

Tab: 'Info'

You can find current firmware versions at www.yaskawa.eu.com in the service area. There are the following possibilities for the firmware update:

- Firmware update online from FW V3.0.0 Chap. 4.14.1 'Firmware update online' page 115
  - Transfer of the firmware file to the CPU via the CPU web page.
  - Triggering the firmware update by means of the operating mode switch.
- Firmware update via memory card <sup>(5)</sup> *Chap. 4.14.2 'Firmware update via memory card' page 116* 
  - Transfer of the firmware file to a memory card.
  - The identification of a firmware file on the memory card takes place by means of a defined naming convention.
  - After PowerON and operating mode switch in the STOP position, the firmware update can be triggered by means of operating mode switch.

```
Show the firmware version via web page
```

The CPU has an integrated *Device web page* that also shows information about the firmware version via *'Info'*. Here you will also find information about the required firmware *'Package'*. With **[Expert View]** you can access the extended "Expert" overview.  $\Leftrightarrow$  *Chap.* 4.11.1 *'Device web page CPU' page 102*

Software	3.0.9	CPU firmware version
Package	Pb000265.pkb	File name for the firmware update

Firmware update > Firmware update online

Current firmware at www.yaskawa.eu.com

You can find the current firmware versions in the 'Download Center' of www.yaskawa.eu.com under 'Firmware 013-CCF0R00'. For example the following file is necessary for the firmware update of the CPU 013-CCF0R00 and its components with hardware release 01:

CPU 013C, Hardware release 01: Pb000265.pkb

When installing a new firmware you have to be extremely careful. Under certain circumstances you may destroy the CPU, for example if the voltage supply is interrupted during transfer or if the firmware file is defective. In this case, please call our hotline!

Please regard that the version of the update firmware has to be different from the existing firmware otherwise no update is executed.

#### 4.14.1 Firmware update online

#### Precondition

- Access is via the IP address of the Ethernet PG/OP channel. & Chap. 4.7 'Hardware configuration - Ethernet PG/OP channel' page 80
- You can access the IP address with a web browser.

It is assumed that there is a connection via the Ethernet PG/OP channel between the PC with web browser and the CPU. This may be tested by Ping to the IP address of the Ethernet PG/OP channel.

Load firmware and store it in working directory

- **1.** Go to the 'Download Center' of www.yaskawa.eu.com.
- 2. Download under 'Firmware 013-CCF0R00' the corresponding zip file for your CPU to your PC ..
- 3. Extract the zip file into your working directory.

#### CAUTION!

With a firmware update an overall reset is automatically executed. If your program is only available in the load memory of the CPU it is deleted! Save your program before executing a firmware update!

Firmware update > Firmware update via memory card

#### Perform firmware update

- RUN - STOP MR
- 1. Switch the operating mode switch of your CPU in position STOP.
- 2. Execute an overall reset. & Chap. 4.13 'Overall reset' page 113
- **3.** Open the CPU web page and select the *'Firmware'* tab.
- 4. Click at 'Browse ...' and navigate to the firmware file in your working directory.
- 5. Click at 'Upload'.
  - ⇒ The firmware file is checked for plausibility and transmitted to the CPU. After the transfer, the firmware versions are matched and listed with the note if a firmware update is possible.
- **6.** You start the firmware update by tipping the operating mode switch downwards to MR and then leaving the switch in STOP position.
  - ⇒ During the update process, the LEDs SF and FC are alternately blinking. This may last several minutes.
- **7.** The update is successful finished when the LEDs PW, SF, ST, FC and SD are on. If they are blinking fast, an error occurred.
- 8. Turn power OFF and ON.
  - After the start-up, the CPU is ready for operation with the new firmware. The current firmware version can be determined via the web page of the CPU.

### 4.14.2 Firmware update via memory card

#### Overview

- For the firmware update via memory card an accordingly prepared memory card must be in the CPU during the start-up.
- So a firmware files can be recognized and assigned with start-up, a pkb file name is reserved for each hardware revision, which begins with "pb" and differs in a number with 6 digits.
- In the System SLIO CPU, the pkb file name can be shown via the web page.
- After PowerON and operating mode switch of the CPU in STOP, the CPU checks if there is a pkb file at the memory card. If this firmware version is different to the existing firmware version, this is indicated by blinking of the LEDs and the firmware may be installed by an update request.

The procedure here describes the update <u>from</u> the CPU firmware version V2.4.0. The update of an older version to the firmware version V2.4.0 has to be done via pkg files. For this refer to the corresponding manual for your CPU version.

Load firmware and transfer it to memory card

- 1. So to the 'Download Center' of www.yaskawa.eu.com.
- **2.** Download under *'Firmware 013-CCF0R00'* the corresponding zip file for your CPU to your PC..
- **3.** Unzip the zip file and copy the pgb file to the root directory of your memory card.

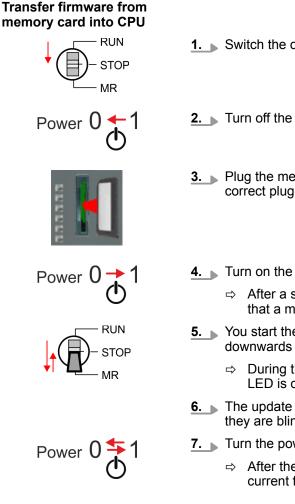

#### CAUTION!

With a firmware update an overall reset is automatically executed. If your program is only available in the load memory of the CPU it is deleted! Save your program before executing a firmware update!

Power (

Firmware update > Firmware update via memory card

- 1. Switch the operating mode switch of your CPU in position STOP.
- 2. Turn off the power supply.
- 3. Plug the memory card with the firmware file into the CPU. Please take care of the correct plug-in direction of the memory card.
- **4.** Turn on the power supply.
  - ⇒ After a short boot-up time, the alternate blinking of the LEDs SF and FC shows that a more current firmware file was found at the memory card.
- 5. Solution Start the transfer of the firmware as soon as you tip the operating mode switch downwards to MR within 10s and then leave the switch in STOP position.
  - ⇒ During the update process, the LEDs SF and FC are alternately blinking and SD LED is on. This may last several minutes.
- 6. The update is successful finished when the LEDs PW, SF, ST, FC and SD are on. If they are blinking fast, an error occurred.
- 7. Turn the power supply off and on again.
  - $\Rightarrow$  After the start-up, the CPU is ready for operation with the new firmware. The current firmware version can be determined via the web page of the CPU.

OP

MR

Reset to factory settings

#### Reset to factory settings 4.15

Proceeding

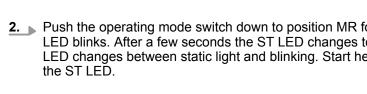

- With the following proceeding the internal RAM of the CPU is completely deleted and the CPU is reset to delivery state.
- Please regard that the MPI address is also reset to default 2 and the IP address of the Ethernet PG/OP channel is reset to 0.0.0.0!
- A factory reset may also be executed by the command FACTORY RESET. § Chap. 4.18 'CMD - auto commands' page 122
- 1. Switch the CPU to STOP.
- 2. Push the operating mode switch down to position MR for 30 seconds. Here the ST LED blinks. After a few seconds the ST LED changes to static light. Now the ST LED changes between static light and blinking. Start here to count the static light of the ST LED.
- 3. After the 6. Static light release the operating mode switch and tip it downwards to MR.
  - For the confirmation of the resetting procedure the green RN LED lights up ⇒ once. This means that the RAM was deleted completely.

If the ST LED is on, only an overall reset has been performed and the reset to factory setting has been failed. In this case you can repeat the procedure. A factory reset can only be executed if the ST LED has static light for exact 6 times.

4. The update is successful finished when the LEDs PW, ST, SF, FC and MC are on.

5. Turn power OFF and ON.

#### 4.16 Deployment storage media - VSD, VSC

Overview

VSD

At the front of the CPU there is a slot for storage media. Here the following storage media can be plugged:

- VSD VIPA SD-Card
  - External memory card for programs and firmware.
- VSC VIPASetCard
  - External memory card (VSD) for programs and firmware with the possibility to unlock optional functions like work memory and field bus interfaces.
  - These functions (FSC: Feature Set Code) can be purchased separately.
  - To activate a FSC the corresponding card is to be installed and a Overall reset is to be established. & Chap. 4.13 'Overall reset' page 113

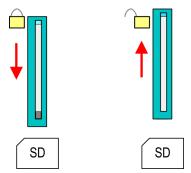

To avoid malfunctions, you should use memory cards of Yaskawa. These correspond to the industrial standard. A list of the currently available VSD respectively VSC can be found at www.yaskawa.eu.com

You can cause the CPU to load a project automatically respectively to execute a command file by means of pre-defined file names.

VSDs are external storage media based on SD memory cards. VSDs are pre-formatted with the PC format FAT 16 (max. 2GB) and can be accessed via a card reader. After PowerON respectively an overall reset the CPU checks, if there is a VSD with data valid for the CPU.

Push the VSD into the slot until it snaps in leaded by a spring mechanism. This ensures contacting. By sliding down the sliding mechanism, a just installed VSD card can be protected against drop out.

To remove, slide the sliding mechanism up again and push the storage media against the spring pressure until it is unlocked with a click.

#### **CAUTION!**

If the media was already unlocked by the spring mechanism, with shifting the sliding mechanism, a just installed memory card can jump out of the slot!

VSC

The VSC is a VSD with the possibility to enable optional functions (FSCs). Here you have the opportunity to accordingly expand your work memory respectively enable field bus functions. Information about the enabled functions can be shown via the web page. Schap. 4.11 'Accessing the web server' page 101

Deployment storage media - VSD, VSC

#### CAUTION!

Please regard that the VSC must remain plugged when you've enabled optional functions at your CPU. Otherwise the SF LED is on and the CPU switches to STOP after 72 hours. As soon as an activated VSC is not plugged, the SF LED is on and the "TrialTime" counts downwards from 72 hours to 0. After 72 hours the CPU switches to STOP state. By plugging the VSC, the SF LED expires and the CPU is running again without any restrictions.

The VSC cannot be replaced by a VSC of the same optional functions. The activation code is fixed to the VSD by means of an unique serial number. Here the function as an external memory card is not affected.

# Accessing the storage medium

To the following times an access takes place on a storage medium:

After overall reset

- The CPU checks if a VSC is inserted. If so, the corresponding optional functions (FSCs) are enabled.
- The CPU checks whether a project S7PROG.WLD exists. If so, it is automatically loaded.

### After PowerON

- The CPU checks whether a project AUTOLOAD.WLD exists. If so, an overall reset is executed and the project is automatically loaded.
- The CPU checks whether a command file with the name VIPA\_CMD.MMC exists. If so the command file is loaded and the commands are executed.
- After PowerON and CPU STOP the CPU checks if there is a \*.pkb file (firmware file). If so, this is shown by the CPU by blinking LEDs and the firmware may be installed by an update request. Chap. 4.14 'Firmware update' page 114

In STOP state when inserting a memory card

If a memory card is plugged in STOP state, which contains a command file VIPA\_CMD.MMC, the command file is loaded and the containing instructions are executed.

The FC/SFC 208 ... FC/SFC 215 and FC/SFC 195 allow you to include the memory card access into your user application. More information about this may be found in the manual "SPEED7 Operation List".

# 4.17 Extended know-how protection

#### Overview

Please note that this functionality is not supported by the Siemen Portal!	s TIA
---	-------

Besides the "standard" Know-how protection the CPUs provide an "extended" know-how protection that serves a secure block protection for accesses of 3. persons.

- Standard protection
  - The standard protection from Siemens transfers also protected blocks to the PG but their content is not displayed.
  - But with according manipulation the know-how protection is not guaranteed.
- Extended protection
  - The "extended" know-how protection offers the opportunity to store blocks permanently in the CPU.
  - With the "extended" protection you transfer the protected blocks to a memory card into a WLD-file named protect.wld.
  - By plugging the memory card and then an overall reset the blocks in the protect.wld are permanently stored in the CPU.
  - You may protect OBs, FBs and FCs.
  - When back-reading the protected blocks into the PG, exclusively the block header are loaded. The block code that is to be protected remains in the CPU and cannot be read.

Protect blocks with protect.wld Create a new wld file in your project engineering tool with 'File  $\rightarrow$  Memory Card file  $\rightarrow$  New'.

- 2. Rename the wld file to "protect.wld".
- **3.** Transfer the according blocks into the file by dragging them with the mouse from the project to the file window of protect.wld.
- **4.** Transfer the file protect.wld to a memory card.
- **5.** Plug the memory card into the CPU and execute an *overall reset.* § Chap. 4.13 'Overall reset' page 113
  - ⇒ The overall reset stores the blocks in protect.wld permanently in the CPU protected from accesses of 3. persons.

Protection behaviourProtected blocks are overwritten by a new protect.wld. Using a PG 3. persons may<br/>access protected blocks but only the block header is transferred to the PG. The block<br/>code that is to be protected remains in the CPU and cannot be read.

**Change respectively delete protected blocks Protected blocks Protected blocks in the RAM of the CPU may be substituted at any time by blocks with the same name.** This change remains up to next overall reset. Protected blocks may permanently be overwritten only if these are deleted at the protect.wld before. By transferring an empty protect.wld from the memory card with an overall reset, you may delete all protected blocks in the CPU.

**Usage of protected blocks** Due to the fact that reading of a "protected" block from the CPU monitors no symbol labels it is convenient to provide the "block covers" for the end user. For this, create a project of all protected blocks. Delete all networks in the blocks so that these only contain the variable definitions in the according symbolism.

CMD - auto commands

#### 4.18 CMD - auto commands

Overview	A Command file at a memory card is automatically executed under the following condi- tions:
	<ul> <li>CPU is in STOP and memory card is plugged</li> <li>After each PowerON</li> </ul>
Command file	<ul> <li>The <i>Command</i> file is a text file, which consists of a command sequence to be stored as VIPA_cmd.mmc in the root directory of the memory card.</li> <li>The file has to be started by CMD_START as 1. command, followed by the desired commands (no other text) and must be finished by CMD_END as last command.</li> <li>Text after the last command <i>CMD_END</i> e.g. comments is permissible, because this is ignored.</li> <li>As soon as the command file is recognized and executed each action is stored at the memory card in the log file logfile.txt.</li> <li>For each executed command a diagnostics entry may be found in the diagnostics buffer.</li> </ul>
Commands	Please regard the command sequence is to be started with CMD_START and ended with

ommand sequence is to be started with CMD\_START and ended with CMD\_END.

Command	Description	Diagnostics entry
CMD_START	In the first line CMD_START is to be located.	0xE801
	There is a diagnostics entry if CMD_START is missing.	0xE8FE
WAIT1SECOND	Waits about 1 second.	0xE803
LOAD_PROJECT	The function "Overall reset and reload from memory card" is executed. The wld file located after the command is loaded else "s7prog.wld" is loaded.	0xE805
SAVE_PROJECT	The recent project (blocks and hardware configuration) is stored as "s7prog.wld" at the memory card. If the file just exists it is renamed to "s7prog.old". If your CPU is pass- word protected so you have to add this as parameter. Oth- erwise there is no project written.	0xE806
	Example: SAVE_PROJECT password	
FACTORY_RESET	Executes "factory reset".	0xE807
DIAGBUF	The current diagnostics buffer of the CPU is stored as "dia- gbuff.txt" at the memory card.	0xE80B
SET_NETWORK	IP parameters for Ethernet PG/OP channel may be set by means of this command. The IP parameters are to be given in the order IP address, subnet mask and gateway in the format x.x.x.x each separated by a comma. Enter the IP address if there is no gateway used.	0xE80E
CMD_END	In the last line CMD_END is to be located.	0xE802
WEBPAGE	Saves all information on the device web page (Expert- View) as <i>webpage.txt</i> on the memory card <i>S Chap. 4.11</i> <i>Accessing the web server</i> page 101	0xE804
WEBVISU_PGOP_ENABLE	Enable WebVisu project via Ethernet PG/OP channel	0xE82C
WEBVISU_PGOP_DISABLE <sup>1</sup>	Disable WebVisu project via Ethernet PG/OP channel	0xE82D

#### Deployment CPU 013-CCF0R00

CMD - auto commands

Command	Description	Diagnostics entry
OPCUA_PGOP_ENABLE	Enable OPC UA project via Ethernet PG/OP channel	0xE830
OPCUA_PGOP_DISABLE	Disable OPC UA project via Ethernet PG/OP channel	0xE831
<ol> <li>After a power cycle or loading a hardware configuration project is set to the default value "enabled".</li> </ol>	, the settings are retained. With reset to the factory settings or over all reset, the WebVisu	

The structure of a command file is shown in the following. The corresponding diagnostics entry is put in parenthesizes.

### Example 1

Examples

CMD_START	Marks the start of the command sequence (0xE801)
LOAD_PROJECT proj.wld	Execute an overall reset and load "proj.wld" (0xE805)
WAIT1SECOND	Wait ca. 1s (0xE803)
DIAGBUF	Store diagnostics buffer of the CPU as "diagbuff.txt" (0xE80B)
CMD_END	Marks the end of the command sequence (0xE802)
arbitrary text	Text after the command CMD_END is not evaluated.

#### Example 2

CMD_START	Marks the start of the command sequence (0xE801)
LOAD_PROJECT proj2.wld	Execute an overall reset and load "proj2.wld" (0xE805)
WAIT1SECOND	Wait ca. 1s (0xE803)
WAIT1SECOND	Wait ca. 1s (0xE803)
	IP parameter (0xE80E)
SET_NETWORK 172.16.129.210,255.255.2	24.0,172.16.129.210
WAIT1SECOND	Wait ca. 1s (0xE803)
WAIT1SECOND	Wait ca. 1s (0xE803)
DIAGBUF	Store diagnostics buffer of the CPU as "diagbuff.txt" (0xE80B)
CMD_END	Marks the end of the command sequence (0xE802)
arbitrary text	Text after the command CMD_END is not evaluated.

The parameters IP address, subnet mask and gateway may be received from the system administrator. Enter the IP address if there is no gateway used. Control and monitoring of variables with test functions

# 4.19 Control and monitoring of variables with test functions

Overview

- For troubleshooting purposes and to display the status of certain variables you can access certain test functions via the menu item **Debug** of the Siemens SIMATIC Manager.
- The status of the operands and the RLO can be displayed by means of the test function 'Debug → Monitor'.
- The status of the operands and the RLO can be displayed by means of the test function '*PLC* → *Monitor/Modify Variables*'.

#### 'Debug 🗲 Monitor'

- This test function displays the current status and the RLO of the different operands while the program is being executed.
  - It is also possible to enter corrections to the program.
  - The processing of the states may be interrupted by means of jump commands or by timer and process-related interrupts.
  - At the breakpoint the CPU stops collecting data for the status display and instead of the required data it only provides the PG with data containing the value 0.
  - The interruption of the processing of statuses does not change the execution of the program. It only shows that the data displayed is no longer valid.

When using the test function "Monitor" the PLC must be in RUN mode!

For this reason, jumps or time and process alarms can result in the value displayed during program execution remaining at 0 for the items below:

- the result of the logical operation RLO
- Status / AKKU 1
- AKKU 2
- Condition byte
- absolute memory address SAZ. In this case SAZ is followed by a "?".

#### 'PLC → Monitor/Modify Variables'

This test function returns the condition of a selected operand (inputs, outputs, flags, data word, counters or timers) at the end of program execution. This information is obtained from the corresponding area of the selected operands. During the controlling of variables respectively in operating mode STOP the input area is directly read. Otherwise only the process image of the selected operands is displayed.

- Control of outputs
  - Serves to check the wiring and proper operation of output modules.
  - If the CPU is in RUN mode, so only outputs can be controlled, which are not controlled by the user program. Otherwise values would be instantly overwritten.
  - If the CPU is in STOP even without user program, so you need to disable the command output lock BASP (*'Enable PO'*). Then you can control the outputs arbitrarily
- Controlling variables
  - The following variables may be modified: I, Q, M, T, C and D.
  - The process image of binary and digital operands is modified independently of the operating mode of the CPU.
  - When the operating mode is RUN the program is executed with the modified process variable. When the program continues they may, however, be modified again without notification.
- Forcing variables
  - You can pre-set individual variables of a user program with fixed values so that they can not be changed or overwritten by the user program of the CPU.
  - By pre-setting of variables with fixed values, you can set certain situations for your user program and thus test the programmed functions.

#### CAUTION!

Please consider that controlling of output values represents a potentially dangerous condition.

Even after a power cycle forced variables remain forced with its value, until the force function is disabled.

These functions should only be used for test purposes respectively for troubleshooting. More information about the usage of these functions may be found in the manual of your configuration tool.

# 4.20 Diagnostic entries

#### Accessing diagnostic data

Separation A 'System specific event IDs' page 333

- You may read the diagnostics buffer of the CPU via the Siemens SIMATIC Manager. Besides of the standard entries in the diagnostics buffer, the CPUs support some additional specific entries as Event-IDs.
- To monitor the diagnostics entries you choose in the Siemens SIMATIC Manager 'PLC → Module information'. Via the register "Diagnostics Buffer" you reach the diagnostics window.
- The current content of the diagnostic buffer is stored at the memory card by means of the CMD DIAGBUF.
- The diagnostic is independent from the operating mode of the CPU. You may store a max. of 100 diagnostic entries in the CPU.

Overview

# 5 Deployment I/O periphery

	•	
5.1	Ove	rview
<b>•</b> •••		

Project engineering and parametrization	<ul> <li>On this CPU the connectors for digital respectively analog signal and <i>Technological</i> functions are combined in a one casing.</li> </ul>
	The project engineering happens in the Siemens SIMATIC Manager as Siemens CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3). Here the CPU 013-CCF0R00 is parameter-ized via the 'Properties' dialog of the Siemens CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).
	For parametrization of the digital I/O periphery and the technological functions the corresponding sub modules of the CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3) is to be used.
	The controlling of the operating modes of the <i>technological functions</i> happens by means of handling blocks of the user program.
I/O periphery	The integrated I/Os of the CPU may be used for technological functions or as standard periphery.
	Technological functions and standard periphery may be used simultaneously with appropriate hardware.
	<ul> <li>Read access to inputs used by <i>technological functions</i> is possible.</li> <li>Write access to used outputs is not possible.</li> </ul>
	<ul> <li>Chap. 5.3 'Analog input' page 128         <ul> <li>2xUx12Bit (0 10V)</li> <li>The analog channels of the module are not isolated to the electronic power supply.</li> </ul> </li> </ul>

	< -0.8V	-32768	8000h	underflow	U: voltage value

## 5.3.3 Wiring

X4	Function	Туре	Description
1	AI 0	I	Al0: Analog input Al 0
2	AI 1	I	AI1: Analog input AI 1
3	Analog 0V	I	4M: GND for analog inputs

#### Cables for analog signals

For the analog signals you have to use isolated cables. With this the interferences can be reduced. The shield of the analog cables should be grounded at both ends. If there are potential differences between the cables, a potential compensation current can flow, which could disturb the analog signals. In this case, you should only ground the shield at one end of the cable.

Temporarily not used analog inputs must be connected to the concerning ground.

Analog input > Parametrization

# 5.3.4 Parametrization

5.3.4.1 Adress assignment

Sub module	Input address	Access	Description
A15/AO2	800	WORD	Analog input channel 0 (X4)
	802	WORD	Analog input channel 1 (X4)

5.3.4.	2 F	ilter

Parameter hardware confi- guration	The analog input part has a filter integrated. The parametrization of the filter happens in the Siemens SIMATIC Manager via the parameter <i>'Integration time'</i> . The default value of the filter is 1000ms. The following values can be entered:
	<ul> <li>'Input 0 ≜ Channel 0'</li> <li>'Input 1 ≜ Channel 1'</li> <li>'Integration time 2.5ms' ≜ 2ms (no filter)</li> <li>'Integration time 16.6ms' ≜ 100ms (small filter)</li> <li>'Integration time 20ms' ≙1000ms (medium filter)</li> </ul>
Parametrization during runtime	By using the record set 1 of the SFC 55 "WR_PARM" you may alter the parametrization in the module during runtime.
	The time needed until the new parametrization is valid can last up to 2ms. During this time, the measuring value output is 7FFFFh.

#### **Record set 1**

Byte	Bit 7 Bit 0	Default
0	Bit 70: reserved	00h
1	<ul> <li>Filter</li> <li>Bit 1, 0: Analog input channel 0 Bit 3, 2: Analog input channel 1 <ul> <li>00b: 'Integration time 2.5ms' ≙ 2ms (no filter)</li> <li>01b: 'Integration time 16.6ms' ≙ 100ms (small filter)</li> <li>10b: 'Integration time 20ms' ≙ 1000ms (medium filter)</li> </ul> </li> <li>Bit 74: reserved</li> </ul>	10h

Digital input > Parametrization

#### 5.4.3 Parametrization

#### 5.4.3.1 Adress assignment

Sub module	Input address	Access	Description
DI24/DO16	136	BYTE	Digital input I+0.0 I+0.7 (X4)
	137	BYTE	Digital input I+1.0 I+1.7 (X4)

#### 5.4.3.2 Hardware interrupt

**Parameter hardware configuration** With the parameter *'Hardware interrupt at ...'* you can specify a hardware interrupt for each input for the corresponding edge. The hardware interrupt is disabled, if nothing is selected (default setting). A diagnostics interrupt is only supported with *Hardware interrupt lost*. Select with the arrow keys the input and enable the according hardware interrupts.

Here is valid:

- Rising edge: Edge 0-1
- Falling edge: Edge 1-0

5.4.3.3 Input delay

Parameter hardware configuration

- The input delay can be configured per channel in groups of 4.
  - An input delay of 0.1ms is only possible with "fast" inputs, which have a max. input frequency of 100kHz Chap. 5.4 'Digital input' page 131. Within a group, the input delay for slow inputs is limited to 0.5ms.
  - Range of values: 0.1ms / 0.5ms / 3ms / 15ms

  - periodically
- Control by the user program via blocks

## 5.6.2 Wiring

5.6.2.1 Counter inputs

### X4: Connector

X4	Function	Туре	Description
4	DI 0	I	+0.0: Counter 0 (A) <sup>1</sup>
5	DI 1	I	+0.1: Counter 0 (B) <sup>1</sup>
7	DI 3	I	+0.3: Counter 1 (A) <sup>1</sup>
8	DI 4	I	+0.4: Counter 1 (B) <sup>1</sup>
10	DI 6	I	+0.6: Counter 2 (A) <sup>1</sup>
11	DI 7	I	+0.7: Counter 2 (B) <sup>1</sup>
13	DI 9	I	+1.1: Counter 3 (A) <sup>1</sup>
14	DI 10	I	+1.2: Counter 3 (B) <sup>1</sup>
15	DI 11	I	+1.3: Gate 3 <sup>1</sup>
19	DI 15	I	+1.7: Latch 3 <sup>1</sup>
20	DC 24V	I	5L+: DC 24V power section supply for counter
21	0 V	I	5M: GND power section supply for counter

1) Max. input frequency 100kHz otherwise 1kHz.

### Input signals

The following sensors can be connected

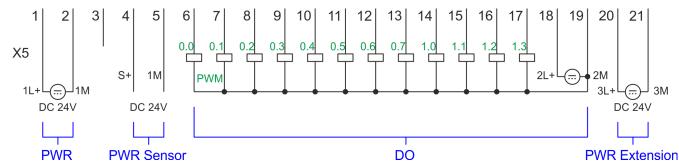

- 24V incremental encoders with two phase-shifted by 90 ° tracks
- 24V pulse encoder with direction signal
- 24V initiator as BERO or beam sensor

For not all inputs are available at the same time, for every counter you may define the input assignment via the parameterization for the following input signals:

- Counter<sub>x</sub> (A)
  - Pulse input for counter signal respectively track A of an encoder for 1-, 2- or 4-fold evaluation.
- Counter<sub>x</sub> (B)
  - Direction signal respectively track B of the encoder. Via the parameterization you
    may invert the direction signal.
- Gate 3
  - Via this input you can if parameterized open the HW gate of Counter 3 with edge 0-1 and start counting.
- Latch 3
  - Via this input via edge 0-1 the current counter value of Counter 3 is stored in a memory that you may read if needed.

#### 5.6.2.2 Counter outputs

#### X5: Connector

X5	Function	Туре	Description
1	Sys DC 24V	I	1L+: DC 24V for electronic section supply
2	Sys 0V	I	1M: GND for electronic section supply
6	DO 0	0	+0.0: Output channel counter 0
7	DO 1	0	+0.1: Output channel counter 1
8	DO 2	0	+0.2: Output channel counter 2
9	DO 3	0	+0.3: Output channel counter 3

19	0 V	I	2M: GND power section supply for on-board counter
20	DC 24V	I	3L+: DC 24V SLIO bus power section supply
21	0 V	I	3M: GND SLIO bus power section supply

#### Output channel Counter<sub>x</sub>

Every counter has an assigned output channel. For each counter you can specify the behavior of the counter output via the parametrization with *'Characteristics of the output'* and *'Pulse duration'*. S Chap. 5.6.4.3 *'Counter' page 139* 

5.6.3 Proceeding	
Hardware configuration	In the Siemens SIMATIC Manager the following steps should be executed:
	<b>1.</b> Perform a hardware configuration for the CPU. Schap. 4.5 'Hardware configura- tion - CPU' page 77
	2. Double-click the counter sub module of the CPU CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).
	⇒ The dialog 'Properties' is opened.
	3. As soon as you select the operating mode for the corresponding channel, a dialog box with default values for this counter mode is created and shown.
	<b>4.</b> Perform the required parameter settings.
	5. ▶ Safe your project with 'Station → Safe and compile'.
	<b>6.</b> Transfer your project to your CPU.
User program	<ul> <li>The SFB 47 should cyclically be called (e.g. OB 1) for controlling the counter functions.</li> <li>The SFB is to be called with the corresponding instance DB. Here the parameters of the SFB are stored.</li> <li>Among others the SFB 47 contains a request interface. Hereby you get read and write access to the registers of the appropriate counter.</li> <li>So that a new job may be executed, the previous job must have be finished with JOB_DONE = TRUE.</li> <li>Per channel you may call the SFB in each case with the same instance DB, since the data necessary for the internal operational are stored here.</li> <li>Writing accesses to outputs of the instance DB is not permissible.</li> <li>Starting, stopping and interrupting a count function of <i>Counter 0</i> to <i>Counter 2</i> exclusively happens via the SW gate by setting the SW gate of the SFB 47. You can also activate input <i>'Gate 3'</i> via the parametrization for <i>Counter 3</i>.</li> </ul>
	More information about the usage of this block may be found in the manual "SPEED7 Operation List".

# 5.6.4 Parametrization

### 5.6.4.1 Address assignment

Sub module	Input address	Access	Description
Counter	816	DINT	Channel 0: Counter value
	820	DINT	Channel 1: Counter value
	824	DINT	Channel 2: Counter value
	828	DINT	Channel 3: Counter value

Sub module	Output address	Access	Description
Counter	816	DWORD	reserved
	820	DWORD	reserved
	824	DWORD	reserved
	828	DWORD	reserved

#### 5.6.4.2 Interrupt selection

Via 'Basic parameters' you can reach 'Select interrupt'. Here you can define the interrupts the CPU will trigger. The following parameters are supported:

- None: The interrupt function is disabled.
- Process: The following events of the counter can trigger a hardware interrupt (selectable via 'Count'):
  - Hardware gate opening
  - Hardware gate closing
  - On reaching the comparator
  - on Counting pulse
  - on overflow
  - on underflow
- Diagnostics+process: A diagnostics interrupt is only triggered when a hardware interrupt was lost.

#### 5.6.4.3 Counter

Parameter hardware configuration Default values and structure of this dialog box depend on the selected 'Operating mode'.

Please consider that the range of values could be limited due to the used projecting tool. With the SPEED7 Studio there are no limitations. & Chap. 12 'Configuration with SPEED7 Studio' page 275

#### Parameter overview

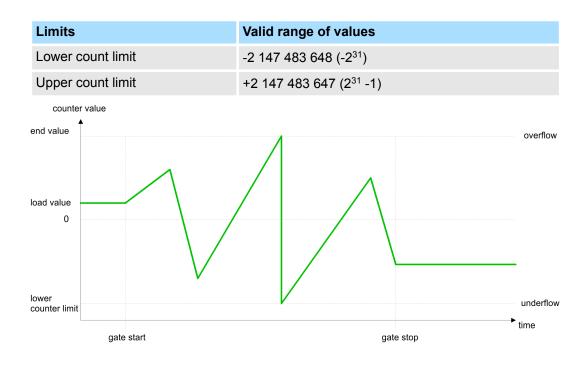

Operating parameters	Description	Assignment
Main count direction	<ul> <li>None No restriction of the counting range</li> <li>Up: Restricts the up-counting range. The counter starts from 0 or <i>load value</i>, counts in positive direction up to the declaration <i>end value</i> -1 and then jumps back to <i>load value</i> at the next positive transducer pulse.</li> <li>Down: Restricts the down-counting range. The counter starts from the declared <i>start value</i> or <i>load value</i> in negative direction, counts to 1 and then jumps to <i>start value</i> at the next negative encoder pulse. Function is disable with <i>count continuously</i>.</li> </ul>	None
Gate function	<ul> <li><i>Cancel count:</i> The count starts when the gate opens and resumes at the <i>load value</i> when the gate opens again.</li> <li><i>Stop count:</i> The count is interrupted when the gate closes and resumed at the last actual counter value when the gate opens again.</li> <li><i>Chap. 5.6.6.2 'Gate function' page 150</i></li> </ul>	Abort count process
Start value	Start value with counting direction backward.	2147483647 (2 <sup>31</sup> -1)
End value	End value with main counting direction forward.	
	Range of values: 22147483647 (2 <sup>31</sup> -1)	
Comparison value	<ul> <li>The count value is compared with the <i>comparison value</i>. See also the parameter "Characteristics of the output":</li> <li>No main counting direction <ul> <li>Range of values: -2)<sup>31</sup> to +2)<sup>31</sup>-1</li> </ul> </li> <li>Main counting direction forward <ul> <li>Range of values: -2<sup>31</sup> to end value-1</li> </ul> </li> <li>Main counting direction backward <ul> <li>Range of values: 1 to +2<sup>31</sup>-1</li> </ul> </li> </ul>	0
Hysteresis	The <i>hysteresis</i> serves the avoidance of many toggle pro- cesses of the output, if the counter value is in the range of the <i>comparison value</i> . 0, 1: <i>Hysteresis</i> disabled Range of values: 0 to 255	0

Input	Description	Assignment
Signal evaluation	<ul> <li>Specify the signal of the connected encoder:</li> <li>Pulse/direction At the input count and direction signal are connected</li> </ul>	Pulse/direction
	<ul> <li>At the input there is an encoder connected with the following evaluation:</li> <li>Rotary encoder single</li> <li>Rotary encoder double</li> <li>Rotary encoder quadruple</li> </ul>

#### 5.6.5 Counter operating modes

- 5.6.5.1 Count continuously
  - In this operating mode the counter counts starting with the *load value*.
  - When the counter counts forward and reaches the upper count limit and another counting pulse in positive direction arrives, it jumps to the lower count limit and counts from there on.
  - When the counter counts backwards and reaches the lower count limit and another counting pulse in negative direction arrives, it jumps to the upper count limit and counts from there on.
  - The counter limits are fix set to maximum range.
  - With overflow or underflow the status bits STS\_OFLW respectively STS\_UFLW are set in SFB 47. These bits remain set until these are reset with RES\_STS. If enabled additionally a hardware interrupt is triggered.

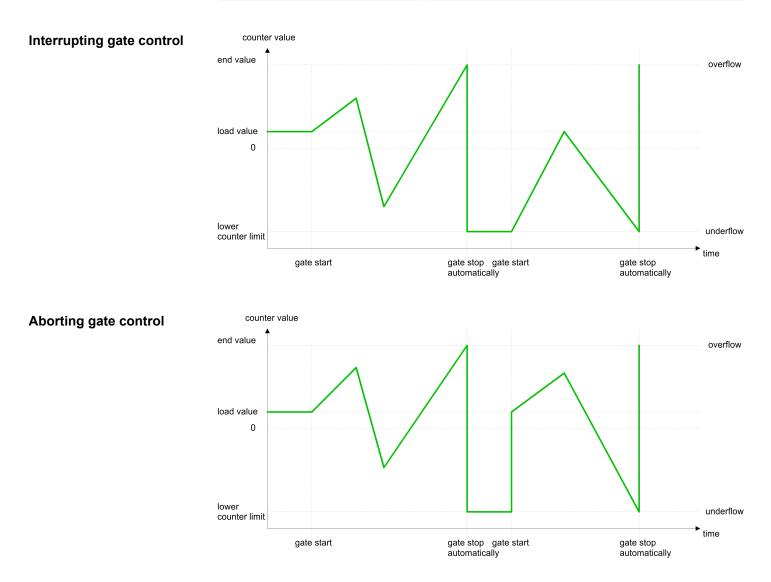

Counting > Counter operating modes

#### 5.6.5.2 Count once

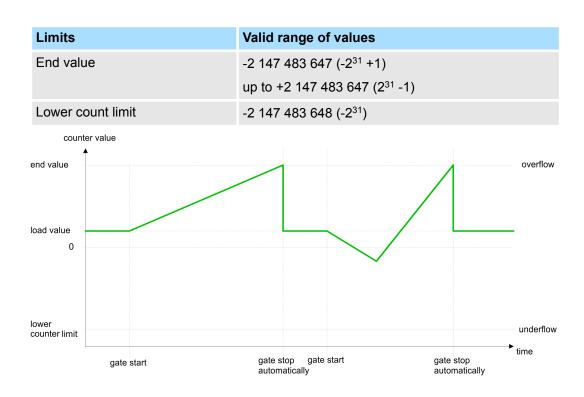

- 5.6.5.2.1 No main counting direction
  - The counter counts once starting with *load value*.
  - It is counted forward or backward.
  - The counter limits are fix set to maximum range.
  - At over- or underflow at the count limits, the counter jumps to the according other count limit and the gate is automatically closed.
  - To restart the count process, you have to generate an edge 0-1 at the gate ♦ Chap. 5.6.6.2 'Gate function' page 150.
  - With the configured 'Gate function' 'Interrupt count' the counting is continued with current Counter value.
  - With configured 'Gate function' 'Cancel count' the counter starts with the Load value.

Limits	Valid range of values
Lower count limit	-2 147 483 648 (-2 <sup>31</sup> )
Upper count limit	+2 147 483 647 (2 <sup>31</sup> -1)

#### 5.6.5.2.2 Main counting direction forward

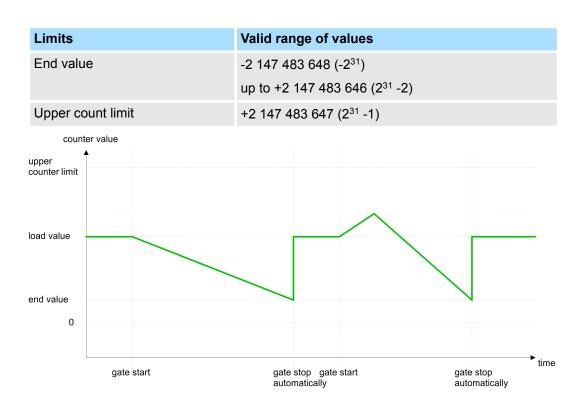

- The counter counts forward starting with the *load value*.
- When the counter reaches the End value -1 in positive direction, it jumps to the load value at the next count pulse and the gate is automatically closed.
- To restart the count process, you have to generate an edge 0-1 at the gate <a>S Chap. 5.6.6.2 'Gate function' page 150. The counter counts starting with the load value.</a>
- You may exceed the lower count limit.

Counting > Counter operating modes

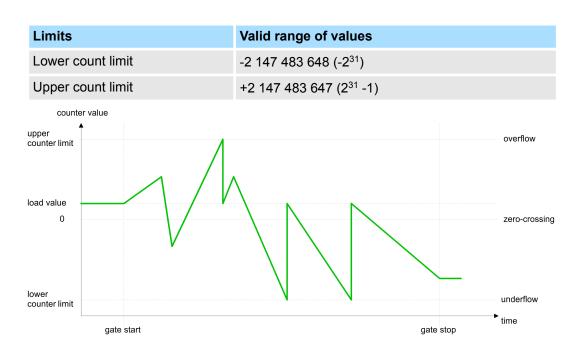

#### 5.6.5.2.3 Main counting direction backward

- The counter counts backward starting with the *load value*.
- When the counter reaches the End value +1 in positive direction, it jumps to the load value at the next count pulse and the gate is automatically closed.
- To restart the count process, you have to generate an edge 0-1 at the gate <a>S Chap. 5.6.6.2 'Gate function' page 150. The counter counts starting with the load value.</a>
- You may exceed the upper count limit.

#### 5.6.5.3 Count periodically

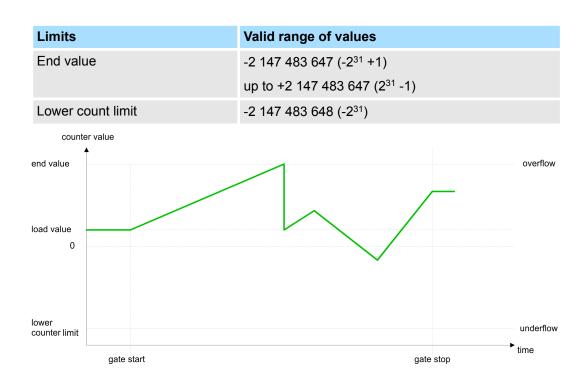

- 5.6.5.3.1 No main counting direction
  - The counter counts forward or backwards starting with the *load value*.
  - At over- or underrun at the count limits, the counter jumps to the *load value* and continues counting. If enabled additionally a hardware interrupt is triggered.
  - The counter limits are fix set to maximum range.

Counting > Counter operating modes

#### 5.6.5.3.2 Main counting direction forward

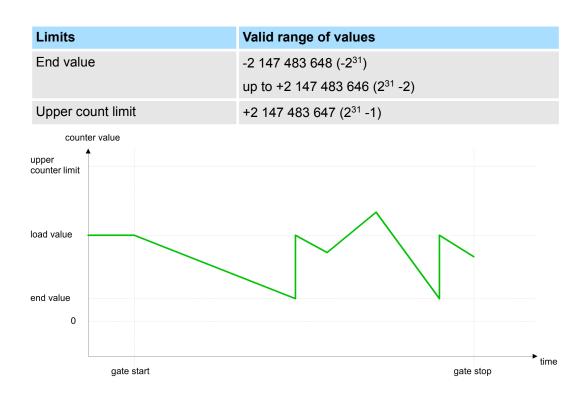

- The counter counts forward starting with the *load value*.
- When the counter reaches the end value -1 in positive direction, it jumps to the *load* value at the next positive count pulse and continues counting. If enabled additionally a hardware interrupt is triggered.
- You may exceed the lower count limit.

#### 5.6.5.3.3 Main counting direction backward

#### Main counting direction backward

- The counter counts backward starting with the *load value*.
- When the counter reaches the end value +1 in positive direction, it jumps to the load value at the next negative count pulse and continues counting. If enabled additionally a hardware interrupt is triggered.
- You may exceed the upper count limit.

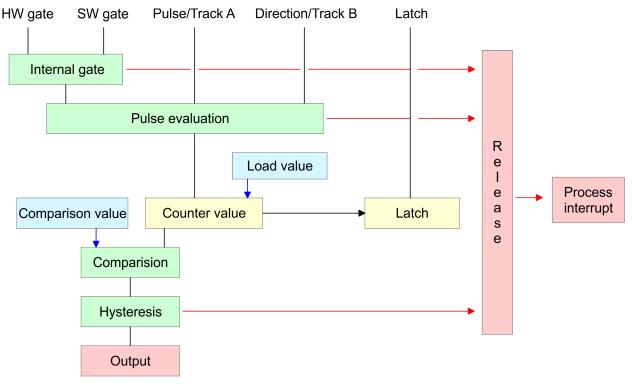

#### 5.6.6 Counter - Additional functions

5.6.6.1 **Overview** 

#### Schematic structure

The illustration shows how the additional functions influence the counting behavior. The following pages describe these additional functions in detail:

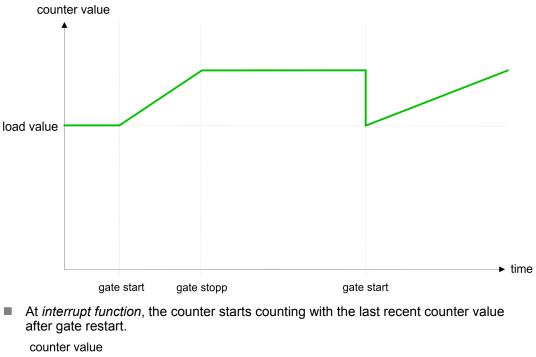

#### 5.6.6.2 **Gate function**

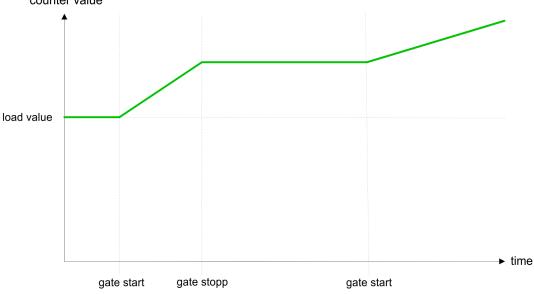

**Function** 

- Starting, stopping and interrupting a count function of counter 0 to counter 2 exclusively happens via the SW gate by setting the SW gate of SFB 47.
- Starting, stopping and interrupting a count function of counter 3 happens via the internal gate (I gate). The i gate is the result of logic operation of HW gate and SW gate. The HW gate evaluation of the connection 'Gate 3' may be deactivated by the parametrization. With a de-activated HW gate evaluation the triggering exclusively happens by setting the SW gate of SFB 47.

#### Gate function abort and The parametrization defines if the gate interrupts or aborts the counter process. interrupt

At abort function the counter starts counting with the load value after gate restart. 

#### Counter 0 ... 2

SW gate	Gate function	Reaction counter 0 2
Edge 0-1	Abort count process	Restart with load value
Edge 0-1	Interrupt count process	Continue

#### 5.6.6.3 Comparator

#### Function

In the CPU a *comparison value* may be stored. During the counting procedure the counter value is compared with the *comparative value*. Depending on the result of the comparison the output channel of the counter and the status bit of STS\_CMP of SFB 47 can be set. In addition, you can configure a hardware interrupt. A *comparison value* can be specified via the parametrization respectively the job interface of SFB 47.

#### 5.6.6.4 Additional functions counter 3

Exclusively counter 3 has the following additional functions:

- HW gate via Gate 3
- Latch function

#### 5.6.6.4.1 HW gate via Gate 3

Starting, stopping and interrupting a count function of counter 3 happens via the internal gate (I gate). The i gate is the result of logic operation of HW gate and SW gate. The HW gate evaluation of the connection *'Gate 3'* may be deactivated by the parametrization. With a de-activated HW gate evaluation the triggering exclusively happens by setting the SW gate of SFB 47.

#### Counter 3:

SW gate	HW gate	Gate function	Reaction counter 3:
Edge 0-1	de-activated	Abort count process	Restart with load value
Edge 0-1	de-activated	Interrupt count process	Continue
Edge 0-1	1	Abort count process	Continue
1	Edge 0-1	Abort count process	Restart with load value
Edge 0-1	1	Interrupt count process	Continue
1	Edge 0-1	Interrupt count process	Continue

#### Counter 3 - count once

If the internal gate has been closed automatically it may only be opened again under the following conditions:			
SW gate	HW gate	l gate	
1	Edge 0-1	1	
Edge 0-1 (after edge 0-1 at HW gate)	Edge 0-1	1	

#### 5.6.6.4.2 Latch function

Function

- As soon as during a count process an edge 0-1 is recognized at the "Latch" input of counter 3, the current counter value is stored in the according latch register.
- You may access the latch value via the parameter LATCHVAL of SFB 47.
- A just in LATCHVAL loaded value remains after a STOP-RUN transition.

#### 5.6.6.5 Counter output channel

Characteristics of the output

Each counter has an output channel. You pre-define the behavior of the counter output via the parametrization:

- no comparison:
  - The output is used as normal output.
  - SFB 47:
    - The input parameter CTRL\_DO is effect less.

The status bits STS\_DO and STS\_CMP (status comparator in the instance DB) remain reset.

- Counter value ≥ comparison value respectively counter value ≤ comparison value
  - The output remains set as long as the counter value is higher or equal *comparison value* respectively lower or equal *comparison value*.
  - SFB 47:
  - Control bit CTRL\_DO must be set.

The comparison result is shown by the status bit STS\_CMP. This status bit may only be reset if the comparison condition is no longer fulfilled.

- Pulse at comparison value
  - When the counter reaches the *comparison value* the output is set for the parametrized *pulse duration*. When you've set a main counting direction the output is only set at reaching the *comparison value* from the main counting direction.
     If the *pulse duration* = 0, the output is set until the comparison condition is not longer fulfilled.
  - SFB 47:
    - Control bit CTRL\_DO must be set.

The status of the digital output may be shown by the status bit ST\_DO.

The comparison result is shown by the status bit STS\_CMP. The bit may only be reset if the *pulse duration* has expired.

- Pulse duration
  - The pulse duration starts with the setting of the according digital output.
  - The inaccuracy of the *pulse duration* is less than 1ms.
  - There is no past triggering of the *pulse duration* when the *comparison value* has been left and reached again during pulse output.
  - If the *pulse duration* is changed during operation, it will take effect with the next pulse.
  - If the *pulse duration* = 0, the output is set until the comparison condition is not longer fulfilled.
  - Range of values: 0...510ms in steps of 2ms

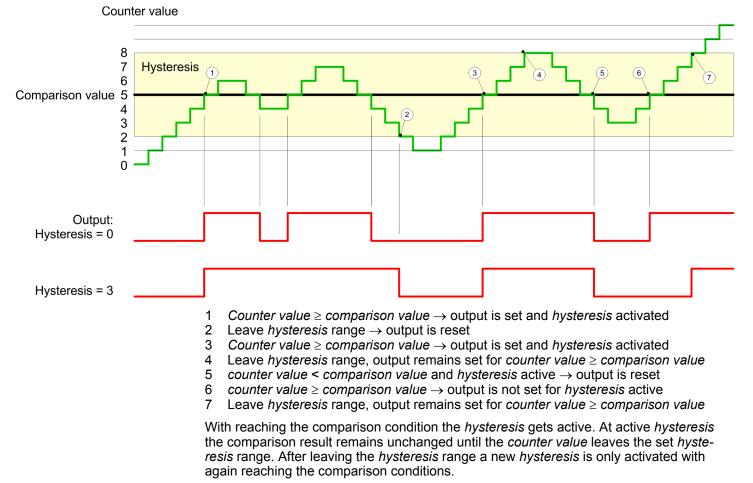

#### 5.6.6.6 Hysteresis function

#### **Hysteresis**

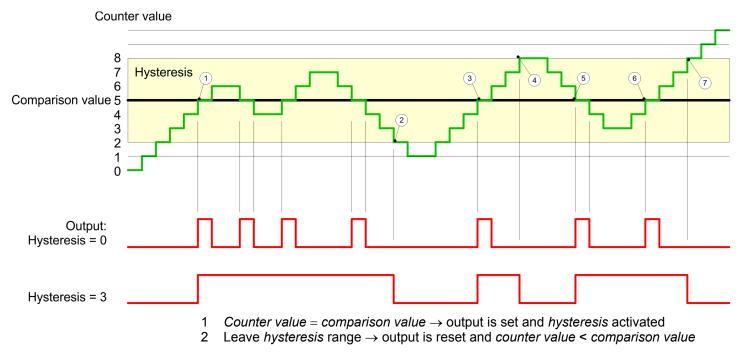

- The hysteresis serves the avoidance of many toggle processes of the output and the interrupt, if the counter value is in the range of the comparison value.
- For the hysteresis you may set a range of 0 to 255.
- The settings 0 and 1 deactivate the hysteresis.
- The *hysteresis* influences zero run, comparison, over- and underflow.
- An activated hysteresis remains active after a change. The new hysteresis range is activated with the next hysteresis event.

The following pictures illustrate the output behavior for *hysteresis* 0 and *hysteresis* 3 for the according conditions:

## Effect at counter value ≥ comparison value

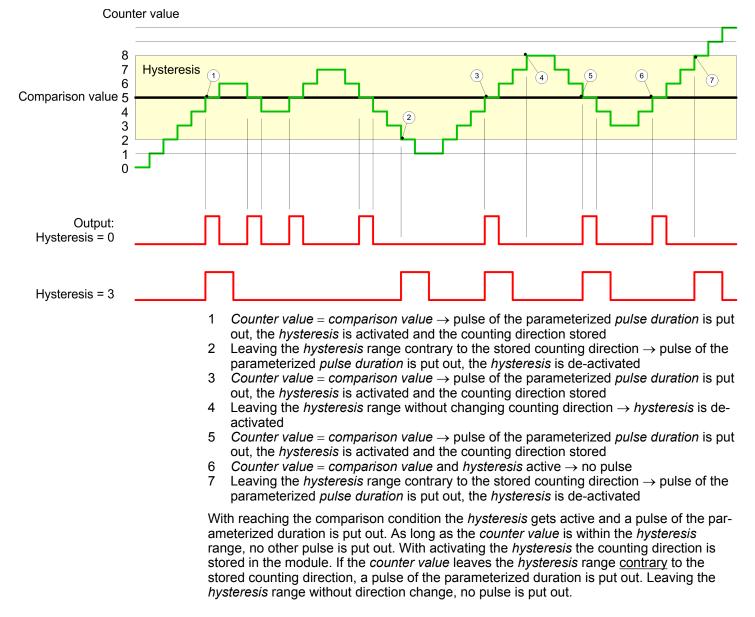

#### Effect at pulse at comparison value with pulse duration Zero

- 3 Counter value = comparison value  $\rightarrow$  output is set and hysteresis activated
- 4 Output is reset for leaving hysteresis range and counter value > comparison value
- 5 Counter value = comparison value  $\rightarrow$  output is set and hysteresis activated
- 6 Counter value = comparison value and hysteresis active  $\rightarrow$  output remains set
- 7 Leave hysteresis range and counter value > comparison value  $\rightarrow$  output is reset

With reaching the comparison condition the *hysteresis* gets active. At active *hysteresis* the comparison result remains unchanged until the *counter value* leaves the set *hysteresis* range. After leaving the *hysteresis* range a new *hysteresis* is only activated with again reaching the comparison conditions.

#### Effect at pulse at comparison value with pulse duration not zero

Frequency measurement > Properties

## 5.6.7 Diagnostics and interrupt

#### Overview

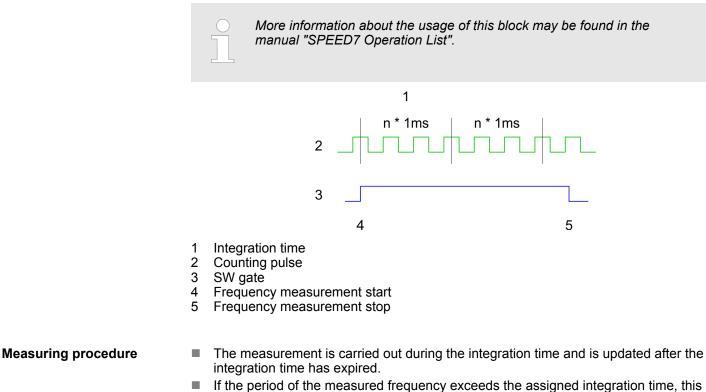

- GSDML
- Edge at an digital interrupt input

Via the hardware configuration you can define the following trigger for a hardware interrupt that can trigger a diagnostics interrupt:

- Reaching the comparison value
- Overflow respectively at overrun upper counter limit
- Underflow respectively at underrun lower counter limit
- Opening the HW gate with open SW gate except for counter 3
- Closing the HW gate with open SW gate except for counter 3

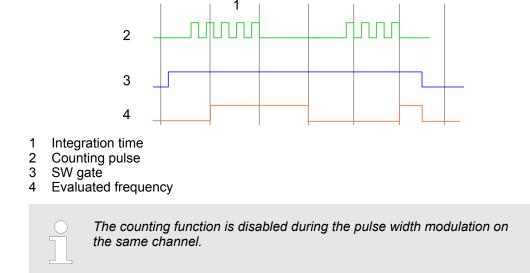

## 5.7 Frequency measurement

- 5.7.1 Properties
- In this operating mode the CPU counts the incoming pulses during a specified integration time and outputs them as frequency value.
- Integration time 10ms ... 10000ms in steps of 1ms configurable
- Control by the user program via SFB 48

- If the period of the measured frequency exceeds the assigned integration time, this means there was no edge 0-1 during the measurement, the measurement value 0 is returned.
- The calculated frequency value is supplied in "mHz" units.
- The measurement value can be read with *MEAS\_VAL* from SFB 48.
- As long as the SW gate is open, you can request the calculated frequency.
- The number of activated channels does not influence the max. frequency, which is defined in the technical data.

Frequency measurement > Wiring

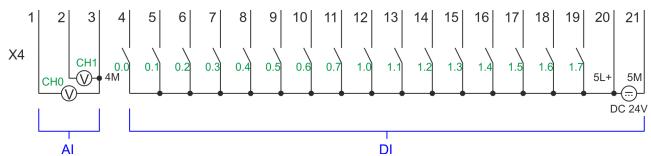

## 5.7.2 Wiring

5.7.2.1 Frequency measurement inputs

For frequency measurement, connect the signal to be measured to the B input of the corresponding counter.

#### X4: Connector

X4	Function	Туре	Description
5	DI 1	I	+0.1: Frequency 0 <sup>1</sup>
8	DI 4	I	+0.4: Frequency 1 <sup>1</sup>
11	DI 7	I	+0.7: Frequency 2 <sup>1</sup>
14	DI 10	I	+1.2: Frequency 3 <sup>1</sup>
20	DC 24V	I	5L+: DC 24V power supply for frequency measurement
21	0 V	I	5M: GND power supply for frequency measurement

1) Max. input frequency 100kHz otherwise 1kHz.

Frequency measurement > Parametrization

5.7.3 Proceeding	
Hardware configuration	In the Siemens SIMATIC Manager the following steps should be executed:
	<b>1.</b> ▶ Perform a hardware configuration for the CPU. <i>© Chap. 4.5 'Hardware configura-</i> <i>tion - CPU' page 77</i>
	2. Double-click the counter sub module of the CPU 314C-2 PN/DP.
	⇒ The dialog 'Properties' is opened.
	3. As soon as you select the operating mode for the corresponding channel, a dialog box with default values for this counter mode is created and shown. Select for the corresponding channel the operating mode 'Frequency counting'.
	<b>4.</b> Perform the required parameter settings.
	5. ▶ Safe your project with <i>'Station → Safe and compile'</i> .
	<b>6.</b> Transfer your project to your CPU.
User program	The SFB 48 should cyclically be called (e.g. OB 1) for controlling the frequency meas- urement.
	The SER is to be called with the corresponding instance DR. Here the parameters of

The SFB is to be called with the corresponding instance DB. Here the parameters of the SFB are stored.

## 5.7.4 Parametrization

#### 5.7.4.1 Address assignment

Sub module	Input address	Access	Description
Counter	816	DINT	Channel 0: Counter value / Frequency value
	820	DINT	Channel 1: Counter value / Frequency value
	824	DINT	Channel 2: Counter value / Frequency value
	828	DINT	Channel 3: Counter value / Frequency value

Sub module	Output address	Access	Description
Counter	816	DWORD	reserved
	820	DWORD	reserved
	824	DWORD	reserved
	828	DWORD	reserved

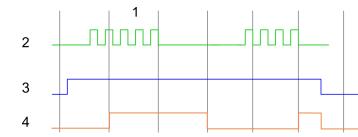

#### 5.7.4.2 Interrupt selection

Via 'Basic parameters' you can reach 'Select interrupt'. Here you can define the interrupts the CPU will trigger. The following parameters are supported:

- None: The interrupt function is de-activated.
- Process: The following events of the frequency measurement can trigger a hardware interrupt (selectable via 'Frequency counting'):
  - End of measurement
- Diagnostics and process: A diagnostics interrupt is only triggered when a hardware interrupt was lost.

#### 5.7.4.3 Frequency measurement

# Parameter hardware confi-<br/>gurationDefault values and structure of this dialog box depend on the selected 'Operating mode'.<br/>The following parameters are relevant for frequency measurement, which must be speci-<br/>fied or determined:

- 1 Integration time
- 2 Counting pulse
- 3 SW gate
- 4 Evaluated frequency

#### Parameter overview

Operating parameters	Description		Assignment
Integration time	Specify the integration time		100ms
	Range of values: 10ms 100	00ms in steps of 1ms	
Max. counting frequency	Specify the max. frequency for	60kHz	
	Frequency	shortest permissible count pulse	
	1kHz	400µs	
	2kHz	200µs	
	5kHz	80µs	
	10kHz	40µs	
	30kHz	13µs	
	60kHz	6.7µs	
	100kHz	4µs	
Hardware interrupt	Description		Assignment
End of measurement	Hardware interrupt at end of n	neasurement	de-activated

5.9 Pulse train

#### 5.9.1 Properties

- By presetting of time parameters, the CPU evaluates a pulse sequence with according pulse/pause ratio and outputs it via the according output channel.
- The output is a pulse-direction command (P/D).
  - Output frequency pattern via pulse train channel
  - To output the direction, an additional output is to be used, which is to be controlled via your user program.
- Channel 0 and 1 are supported
- Control by the user program via SFB 49

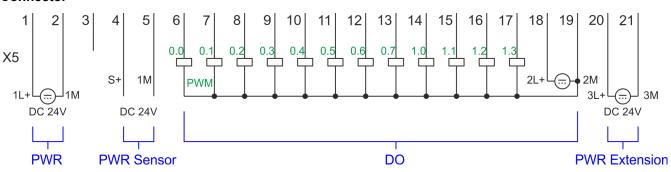

The counting function is disabled during the pulse train output on the same channel.

Pulse train > Proceeding

## 5.9.2 Wiring

5.9.2.1 Pulse train outputs

#### X5: Connector

X5	Function	Туре	Description
1	Sys DC 24V	I	1L+ DC 24V for electronic section supply
2	Sys 0V	I	1M: GND for electronic section supply

## 5.10 Diagnostic and interrupt

#### 5.10.1 Overview

Hardware interrupt

The parametrization allows you to define the following trigger for a hardware interrupt:

- Edge at an digital interrupt input
- Reaching the comparison value
- Overflow respectively at overrun upper counter limit
- Underflow respectively at underrun lower counter limit
- Opening the HW gate with open SW gate except for counter 3
- Closing the HW gate with open SW gate except for counter 3

Diagnostic and interrupt > Process interrupt

#### **Diagnostics interrupt**

The product specific parameters allow you to define the following trigger for a diagnostics interrupt  $\mathcal{G}$  *Chap. 4.9 'Setting product specific CPU parameters' page 90*:

- Hardware interrupt lost
- Error: 2L+ DC 24V DO power section supply
- Error: 3L+: DC 24V SLIO bus power section supply
- Error: 5L+: DC 24V DI power section supply
- Short circuit overload: Sensor
- Short circuit overload: DO

#### 5.10.2 **Process interrupt**

An interrupt for the corresponding channel operating mode can only be triggered if you have additionally parameterized 'Diagnostics+Process' at 'Select interrupt' of the 'Basic parameters'.

A process interrupt causes a call of the OB 40. Within the OB 40 you may find the logical basic address of the module that initialized the process interrupt by using the Local word 6. More detailed information about the initializing event is to find in the *local double word* 8. The assignment of *local double word* 8 depends on the parameterized operating mode of each channel.

#### Local double word 8 of OB 40 at Alarm Inputs

11	<ul> <li>Bit 0: End of measurement channel 3 (end of the integration time)</li> <li>Bit 7 1: 0 (fix)</li> </ul>

#### 5.10.3 Diagnostic interrupt

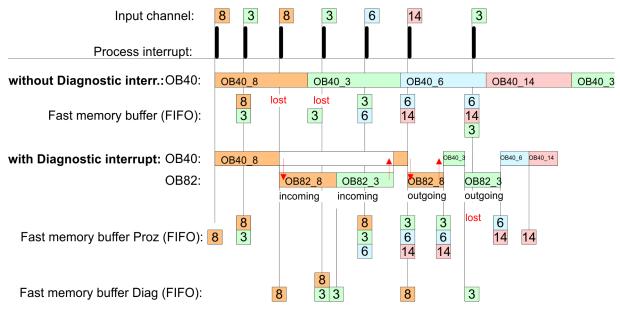

#### Function

An interrupt for the corresponding channel operating mode can only be triggered if you have additionally parameterized 'Diagnostics+Process' at 'Select interrupt' of the 'Basic parameters'.

Via the parameterization (record set 7Fh) you may activate a global diagnostic interrupt for the module. A diagnostic interrupt occurs when during a process interrupt execution in OB 40 another process interrupt is thrown for the same event. The initialization of a diagnostic interrupt interrupts the recent process interrupt execution in OB 40 and branches in OB 82 to diagnostic interrupt processing<sub>incoming</sub>. If during the diagnostic interrupt processing other events are occurring at other channels that may also cause a process res. diagnostic interrupt, these are interim stored. After the end of the diagnostic interrupt processing at first all interim stored diagnostic interrupts are processed in the sequence of their occurrence and then all process interrupts. If a channel where currently a diagnostic

interrupt<sub>incoming</sub> is processed res. interim stored initializes further process interrupts, these get lost. When a process interrupt for which a diagnostic interrupt<sub>incoming</sub> has been released is ready, the diagnostic interrupt processing is called again as diagnostic interrupt<sub>outgoing</sub>. All events of a channel between diagnostic interrupt<sub>incoming</sub> and diagnostic interrupt<sub>outgoing</sub> are not stored and get lost. Within this time window (1. diagnostic interrupt<sub>incoming</sub> until last diagnostic interrupt<sub>outgoing</sub>) the SF-LED of the CPU is on. Additionally for every diagnostic interrupt<sub>incoming</sub>/<sub>outgoing</sub> an entry in the diagnostic buffer of the CPU occurs.

#### Example:

#### Diagnostic interrupt processing

Every OB 82 call causes an entry in the diagnostic buffer of the CPU containing error cause and module address. By using the SFC 59 you may read the diagnostic bytes. At de-activated diagnostic interrupt you have access to the last recent diagnostic event. If you've activated the diagnostic function in your hardware configuration, the contents of record set 0 are already in the local double word 8 when calling the OB 82. The SFC 59 allows you to also read the record set 1 that contains additional information. After leaving the OB 82 a clear assignment of the data to the last diagnostic interrupt is not longer possible. The record sets of the diagnostic range have the following structure:

## **Deployment I/O periphery**

Diagnostic and interrupt > Diagnostic interrupt

Record set 0 Diagnostic <sub>incoming</sub>	Byte	Bit 70
Diagnosticincoming	0	<ul> <li>Bit 0: set at module failure <ul> <li>Counter/Frequency measurement: Process interrupt lost</li> <li>Digital input: Process interrupt lost</li> <li>Missing power supply DI or DO</li> <li>Digital output: short circuit/overload</li> <li>Output Sensor: short circuit/overload</li> <li>SLIO bus: missing supply fieldbus</li> <li>Diagnostic interrupt from SLIO modules</li> </ul> </li> <li>Bit 1: set at internal error <ul> <li>Missing power supply DI or DO</li> <li>Digital output: short circuit/overload</li> </ul> </li> <li>Bit 1: set at internal error <ul> <li>Missing power supply DI or DO</li> <li>Digital output: short circuit/overload</li> <li>Output Sensor: short circuit/overload</li> <li>Output Sensor: short circuit/overload</li> </ul> </li> <li>Bit 2: set at external error <ul> <li>SLIO bus: missing supply fieldbus</li> </ul> </li> <li>Bit 2: set at external error <ul> <li>SLIO bus: missing supply fieldbus</li> </ul> </li> <li>Bit 3: set at channel error</li> <li>SLIO bus: missing supply fieldbus</li> </ul> <li>Bit 4: set at missing external power supply <ul> <li>SLIO bus: missing supply fieldbus</li> </ul> </li> <li>Bit 7 5: 0 (fix)</li>
	1	<ul> <li>Bit 3 0: Module class <ul> <li>1111b: Digital module</li> <li>or</li> <li>1000b: Function module</li> </ul> </li> <li>Bit 4: Channel information present <ul> <li>Counter/Frequency measurement: Process interrupt lost</li> <li>Digital input: Process interrupt lost</li> <li>Missing power supply DI or DO</li> <li>Digital output: short circuit/overload</li> <li>Output Sensor: short circuit/overload</li> <li>SLIO bus: missing supply fieldbus</li> <li>Diagnostic interrupt from SLIO modules</li> </ul> </li> </ul>
	2	<ul> <li>Bit 3 0: 0 (fix)</li> <li>Bit 4: set at missing internal power supply <ul> <li>Missing power supply DI or DO</li> </ul> </li> <li>Bit 7 5: 0 (fix)</li> </ul>
	3	<ul> <li>Bit 5 0: 0 (fix)</li> <li>Bit 6: Process interrupt lost</li> <li>Bit 7: 0 (fix)</li> </ul>

Record set 0 Diagnostic<sub>outgoing</sub> After the removing error a diagnostic message<sub>outgoing</sub> takes place if the diagnostic interrupt release is still active.

Byte	Bit 70
0	<ul> <li>Bit 0: set at module failure <ul> <li>Counter/Frequency measurement: Process interrupt lost</li> <li>Digital input: Process interrupt lost</li> <li>Missing power supply DI or DO</li> <li>Digital output: short circuit/overload</li> <li>Output Sensor: short circuit/overload</li> <li>SLIO bus: missing supply fieldbus</li> <li>Diagnostic interrupt from SLIO modules</li> </ul> </li> <li>Bit 1: set at internal error <ul> <li>Missing power supply DI or DO</li> <li>Digital output: short circuit/overload</li> </ul> </li> <li>Bit 1: set at internal error <ul> <li>Missing power supply DI or DO</li> <li>Digital output: short circuit/overload</li> </ul> </li> <li>Bit 2: set at external error <ul> <li>SLIO bus: missing supply fieldbus</li> </ul> </li> <li>Bit 2: set at external error</li> <li>SLIO bus: missing supply fieldbus</li> </ul> <li>Bit 3: set at channel error</li> <li>SLIO bus: missing supply fieldbus</li> <li>Bit 4: set at missing external power supply <ul> <li>SLIO bus: missing supply fieldbus</li> </ul> </li> <li>Bit 7 5: 0 (fix)</li>

3	Bit 7 0: 0 (fix)

The record set 0 of the alarm interrupts, counter function, frequency measurement and pulse width modulation has the same structure. There are differences in the structure of record set 1.

## Diagnostic record set 1 at *Alarm Inputs*

The record set 1 contains the 4byte of the record set 0 and additionally 12byte module specific diagnostic data. The diagnostic bytes have the following assignment:

Byte	Bit 70
0 3	Content record set 0 🖏 'Record set 0 Diagnostic <sub>incoming</sub> ' page 173
4	<ul> <li>Bit 6 0: Channel type (here 70h)</li> <li>70h: Digital input</li> <li>Bit 7: More channel types present</li> <li>0: no</li> <li>1: yes</li> </ul>
5	Number of diagnostic bits per channel (here 08h)
6	Number of channels of a module (here 08h)
7	<ul> <li>Bit 0: Error in channel group 0 (I+0.0 I+0.3)</li> <li>Bit 1: Error in channel group 1 (I+0.4 I+0.7)</li> <li>Bit 2: Error in channel group 2 (I+1.0 I+1.3)</li> <li>Bit 3: Error in channel group 2 (I+1.4 I+1.7)</li> <li>Bit 7 4: reserved</li> </ul>
8	Diagnostic interrupt due to "process interrupt lost" at Bit 0: input I+0.0 Bit 1: 0 (fix) Bit 2: input I+0.1 Bit 3: 0 (fix) Bit 4: input I+0.2 Bit 5: 0 (fix) Bit 6: input I+0.3 Bit 7: 0 (fix)
9	Diagnostic interrupt due to "process interrupt lost" at Bit 0: input I+0.4 Bit 1: 0 (fix) Bit 2: input I+0.5 Bit 3: 0 (fix) Bit 4: input I+0.6 Bit 5: 0 (fix) Bit 6: input I+0.7 Bit 7: 0 (fix)
10	<ul> <li>Diagnostic interrupt due to "process interrupt lost" at</li> <li>Bit 0: input I+1.0</li> <li>Bit 1: 0 (fix)</li> <li>Bit 2: input I+1.1</li> <li>Bit 3: 0 (fix)</li> <li>Bit 4: input I+1.2</li> <li>Bit 5: 0 (fix)</li> <li>Bit 6: input I+1.3</li> <li>Bit 7: 0 (fix)</li> </ul>

Byte	Bit 70
11	Diagnostic interrupt due to "process interrupt lost" at Bit 0: input I+1.4 Bit 1: 0 (fix) Bit 2: input I+1.5 Bit 3: 0 (fix) Bit 4: input I+1.6 Bit 5: 0 (fix) Bit 6: input I+1.7 Bit 7: 0 (fix)
1215	Bit 7 0: reserved

#### Diagnostic record set 1 at counter function

The record set 1 contains the 4byte of the record set 0 and additionally 12byte module specific diagnostic data. The diagnostic bytes have the following assignment:

Byte	Bit 70
0 3	Content record set 0 & 'Record set 0 Diagnostic <sub>incoming</sub> ' page 173
4	<ul> <li>Bit 6 0: Channel type (here 76h)</li> <li>76h: Function module</li> <li>Bit 7: More channel types present</li> <li>0: no</li> <li>1: yes</li> </ul>
5	Number of diagnostic bits per channel (here 08h)
6	Number of channels of a module (here 04h)
7	<ul> <li>Bit 0: Error in channel group 0 (Counter 0)</li> <li>Bit 1: Error in channel group 1 (Counter 1)</li> <li>Bit 2: Error in channel group 2 (Counter 2)</li> <li>Bit 3: Error in channel group 3 (Counter 3)</li> <li>Bit 7 4: reserved</li> </ul>
8	<ul> <li>Diagnostic interrupt due to "process interrupt lost" at</li> <li>Bit 1, 0: reserved</li> <li>Bit 2: Over-/underflow/end value counter 0</li> <li>Bit 3: Counter 0 reached comparison value</li> <li>Bit 7 4: 0 (fix)</li> </ul>
9	<ul> <li>Diagnostic interrupt due to "process interrupt lost" at</li> <li>Bit 1, 0: reserved</li> <li>Bit 2: Over-/underflow/end value counter 1</li> <li>Bit 3: Counter 1 reached comparison value</li> <li>Bit 7 4: 0 (fix)</li> </ul>
10	<ul> <li>Diagnostic interrupt due to "process interrupt lost" at</li> <li>Bit 1, 0: reserved</li> <li>Bit 2: Over-/underflow/end value counter 2</li> <li>Bit 3: Counter 2 reached comparison value</li> <li>Bit 7 4: 0 (fix)</li> </ul>

Byte	Bit 70
11	<ul> <li>Diagnostic interrupt due to "process interrupt lost" at</li> <li>Bit 0: Gate counter 3 open (activated)</li> <li>Bit 1: Gate counter 3 closed</li> <li>Bit 2: Over-/underflow/end value counter 3</li> <li>Bit 3: Counter 3 reached comparison value</li> <li>Bit 4: Counter 3 new latch value</li> <li>Bit 7 5: 0 (fix)</li> </ul>
12 15	Bit 7 0: reserved

## Diagnostic Record set 1 at frequency measurement

The record set 1 contains the 4byte of the record set 0 and additionally 12byte module specific diagnostic data. The diagnostic bytes have the following assignment:

Byte	Bit 70
0 3	Content record set 0 🔄 'Record set 0 Diagnostic <sub>incoming</sub> ' page 173
4	<ul> <li>Bit 6 0: Channel type (here 76h)</li> <li>76h: Function module</li> <li>Bit 7: More channel types present</li> <li>0: no</li> <li>1: yes</li> </ul>
5	Number of diagnostic bits per channel (here 08h)
6	Number of channels of a module (here 04h)
7	<ul> <li>Bit 0: Error in channel group 4 (Frequency meter 0)</li> <li>Bit 1: Error in channel group 5 (Frequency meter 1)</li> <li>Bit 2: Error in channel group 6 (Frequency meter 2)</li> <li>Bit 3: Error in channel group 7 (Frequency meter 3)</li> <li>Bit 7 4: 0 (fix)</li> </ul>
8	Diagnostic interrupt due to "process interrupt lost" at
	<ul> <li>Bit 0: End of measurement channel 0 (End of integration time)</li> <li>Bit 7 1: 0 (fix)</li> </ul>
9	Diagnostic interrupt due to "process interrupt lost" at
	<ul> <li>Bit 0: End of measurement channel 1 (End of integration time)</li> <li>Bit 7 1: 0 (fix)</li> </ul>
10	Diagnostic interrupt due to "process interrupt lost" at
	<ul> <li>Bit 0: End of measurement channel 2 (End of integration time)</li> <li>Bit 7 1: 0 (fix)</li> </ul>
11	Diagnostic interrupt due to "process interrupt lost" at
	<ul> <li>Bit 0: End of measurement channel 3 (End of integration time)</li> <li>Bit 7 1: 0 (fix)</li> </ul>
12 15	0 (fix)

Fast introduction

## 6 Deployment PtP communication

## 6.1 Fast introduction

General	The CPU has the interface X3 MPI(PtP) with a fix pinout. After an overall reset the inter- face has MPI functionality. By appropriate configuration the PtP function ( <b>p</b> oint <b>to p</b> oint) can be enabled:	
	<ul> <li>PtP functionality</li> <li>Using the PtP functionality the RS485 interface is allowed to connect via serial point-to-point connection to different source res. target systems.</li> </ul>	
Protocols	The protocols respectively procedures ASCII, STX/ETX, 3964R, USS and Modbus are supported.	
Parametrization	The parametrization of the serial interface happens during runtime using the FC/SFC 216 (SER_CFG). For this you have to store the parameters in a DB for all protocols except ASCII.	
Communication	The FCs/SFCs are controlling the communication. Send takes place via FC/SFC 217 (SER_SND) and receive via FC/SFC 218 (SER_RCV). The repeated call of the FC/SFC 217 SER_SND delivers a return value for 3964R, USS and Modbus via RetVal that contains, among other things, recent information about the acknowledgement of the partner station. The protocols USS and Modbus allow to evaluate the receipt telegram by calling the FC/SFC 218 SER_RCV after SER_SND. The FCs/SFCs are included in the consignment of the CPU.	
	Use FCs instead SFCs	

Please regard that the product specific SFCs are not shown in the SLIO CPU. Please use for programming tools e.g. Siemens SIMATIC Manager and TIA Portal the according FCs of the Controls Library.

## Overview FCs/SFCs for serial communication

The following FCs/SFCs are used for the serial communication:

FC/	SFC	Description
FC/SFC 216	SER_CFG	RS485 parameterize
FC/SFC 217	SER_SND	RS485 send
FC/SFC 218	SER_RCV	RS485 receive

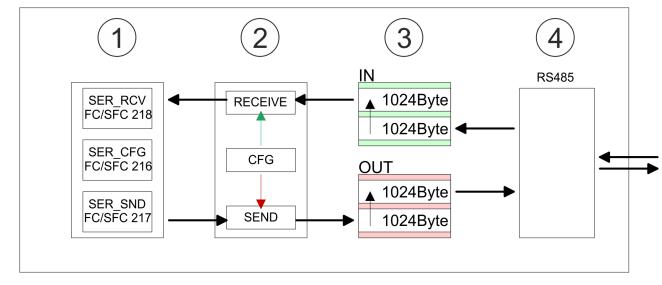

More information about the usage of these blocks may be found in the manual "SPEED7 Operation List".

## 6.2 Principle of the data transfer

**RS485 PtP communication** 

The data transfer is handled during runtime by using FC/SFCs. The principle of data transfer is the same for all protocols and is shortly illustrated in the following.

- Data, which are written into the according data channel by the CPU, is stored in a FIFO send buffer (first in first out) with a size of 2x1024byte and then put out via the interface.
- When the interface receives data, this is stored in a FIFO receive buffer with a size of 2x1024byte and can there be read by the CPU.
- If the data is transferred via a protocol, the embedding of the data to the according protocol happens automatically.
- In opposite to ASCII and STX/ETX, the protocols 3964R, USS and Modbus require the acknowledgement of the partner.
- An additional call of the FC/SFC 217 SER\_SND causes a return value in RetVal that includes among others recent information about the acknowledgement of the partner.
- Further on for USS and Modbus after a SER\_SND the acknowledgement telegram must be evaluated by a call of the FC/SFC 218 SER\_RCV.

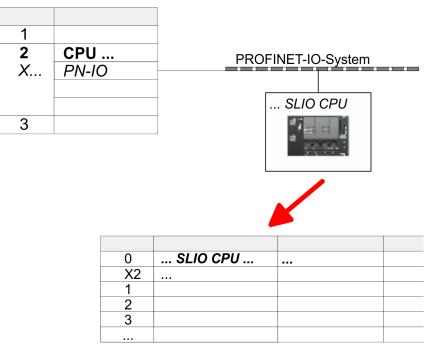

- 1 Program
- 2 Protocol
- 3 FIFO buffer
- 4 Interface

Enable PtP functionality

## 6.3 Enable PtP functionality

## Proceeding

After the  $\Leftrightarrow$  *Chap. 4.5 'Hardware configuration - CPU' page 77* of the CPU you can set the parameters of the CPU in the virtual IO device '... *SLIO CPU'*.

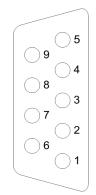

- **1.** Open the properties dialog by a double-click at *... SLIO CPU*.
  - ⇒ The product specific parameters may be accessed by means of the properties dialog.
- **<u>2.</u>** Select at *'Function X3'* the value *'PTP'*.
- 3. Save and transfer your project to the CPU.
  - After a short boot time the interface X3 MPI(PtP) is ready for PtP communication.

# 6.4 Deployment of RS485 interface for PtP

# **Properties RS485**

- Logical states as voltage difference between 2 twisted wires
- Serial bus connection in two-wire technology using half duplex mode
- Data communications up to a max. distance of 500m
- Data communication rate up to 115.2kbaud

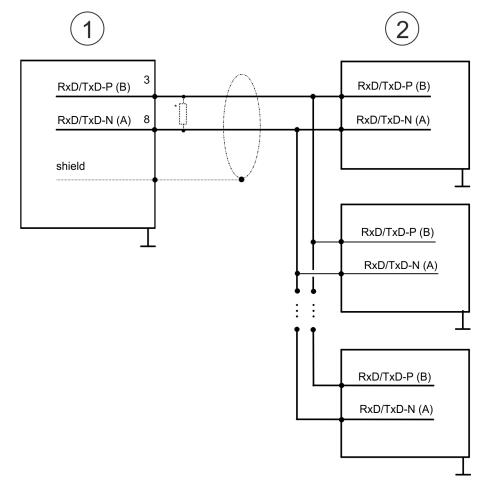

## RS485

9pin	SubD ja	ack
------	---------	-----

Pin	RS485
1	n.c.
2	M24V
3	RxD/TxD-P (Line B)
4	RTS
5	M5V
6	P5V
7	P24V
8	RxD/TxD-N (Line A)
9	n.c.

## Connection

- 1 RS485 interface
- 2 Periphery

$\bigcirc$	*) For traffic-free data transfer use a terminating resistor of approximately
	120Ω.

# 6.5 Parametrization

## 6.5.1 FC/SFC 216 - SER\_CFG - Parametrization PtP

The parametrization happens during runtime deploying the FC/SFC 216 (SER\_CFG). You have to store the parameters for STX/ETX, 3964R, USS and Modbus in a DB.

## 6.6 Communication

6.6.1 FC/SFC 217 - SER\_SND - Send to PtP

This block sends data via the serial interface. The repeated call of the FC/SFC 217 SER\_SND delivers a return value for 3964R, USS and Modbus via RETVAL that contains, among other things, recent information about the acknowledgement of the partner station. The protocols USS and Modbus require to evaluate the receipt telegram by calling the FC/SFC 218 SER\_RCV after SER\_SND.

## 6.6.2 FC/SFC 218 - SER\_RCV - Receive from PtP

This block receives data via the serial interface. Using the FC/SFC 218 SER\_RCV after SER\_SND with the protocols USS and Modbus the acknowledgement telegram can be read.

More information about the usage of these blocks may be found in the manual "SPEED7 Operation List".

## 6.7 Protocols and procedures

Overview

The CPU supports the following protocols and procedures:

- ASCII communication
- STX/ETX
- 3964R
- USS
- Modbus

ASCII

ASCII data communication is one of the simple forms of data exchange. Incoming characters are transferred 1 to 1. At ASCII, with every cycle the read FC/SFC is used to store the data that is in the buffer at request time in a parametrized receive data block. If a telegram is spread over various cycles, the data is overwritten. There is no reception acknowledgement. The communication procedure has to be controlled by the concerning user application. For this you can use the FB 1 - Receive\_ASCII.

```
Protocols and procedures
```

More information about the usage of this block may be found in the manual "SPEED7 Operation List".

STX/ETX

STX/ETX is a simple protocol with start and end ID, where STX stands for **S**tart of **Text** and ETX for **E**nd of **Text**.

- Any data transferred from the periphery must be preceded by a Start followed by the data characters and the end character. Depending of the byte width the following ASCII characters can be transferred: 5bit: not allowed: 6bit: 20...3Fh, 7bit: 20...7Fh, 8bit: 20...FFh.
- The effective data, which includes all the characters between Start and End are transferred to the CPU when the End has been received.
- When data is send from the CPU to a peripheral device, any user data is handed to the FC/SFC 217 (SER\_SND) and is transferred with added Start- and End-ID to the communication partner.
- You may work with 1, 2 or no Start- and with 1, 2 or no End-ID.
- If no End-ID is defined, all read characters are transferred to the CPU after a parameterizable character delay time (Timeout).

As Start-res. End-ID all Hex values from 01h to 1Fh are permissible. Characters above 1Fh are ignored. In the user data, characters below 20h are not allowed and may cause errors. The number of Start- and End-IDs may be different (1 Start, 2 End res. 2 Start, 1 End or other combinations). For not used start and end characters you have to enter FFh in the hardware configuration.

#### Message structure:

Protocols and procedures

3964

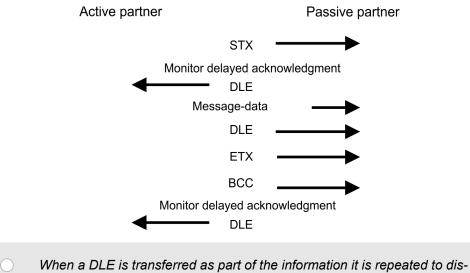

The 3964R procedure controls the data transfer of a point-to-point link between the CPU and a communication partner. The procedure adds control characters to the message data during data transfer. These control characters may be used by the communication partner to verify the complete and error free receipt.

The procedure employs the following control characters:

- STX: Start of Text
- DLE: Data Link Escape
- ETX: End of Text
- BCC: Block Check Character
- NAK: Negative Acknowledge

You may transfer a maximum of 255byte per message.

Procedure

When a DLE is transferred as part of the information it is repeated to distinguish between data characters and DLE control characters that are used to establish and to terminate the connection (DLE duplication). The DLE duplication is reversed in the receiving station.

The 3964R procedure <u>requires</u> that a lower priority is assigned to the communication partner. When communication partners issue simultaneous send commands, the station with the lower priority will delay its send command.

USS

The USS protocol (**U**niverselle **s**erielle **S**chnittstelle = universal serial interface) is a serial transfer protocol defined by Siemens for the drive and system components. This allows to build-up a serial bus connection between a superordinated master and several slave systems. The USS protocol enables a time cyclic telegram traffic by presetting a fix telegram length.

The following features characterize the USS protocol:

- Multi point connection
- Master slave access procedure
- Single master system
- Max. 32 participants
- Simple and secure telegram frame

It is essential:

- You may connect 1 master and max. 31 slaves at the bus
- The single slaves are addressed by the master via an address sign in the telegram.

- The communication happens exclusively in half-duplex operation.
- After a send command, the acknowledgement telegram must be read by a call of the FC/SFC 218 SER\_RCV.

The telegrams for send and receive have the following structure:

#### Master slave telegram

STX	LGE	ADR	PKE		IND		PWE		STW		HSW		BCC
02h			Н	L	Н	L	Н	L	Н	L	Н	L	

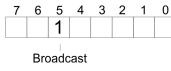

#### Slave master telegram

STX	LGE	ADR	PKE		IND		PWE		ZSW		HIW		BCC
02h			Н	L	Н	L	Н	L	Н	L	Н	L	

	with
	STX - Start sign
	STW - Control word
	LGE - Telegram length
	ZSW - State word
	ADR - Address
	HSW - Main set value
	PKE - Parameter ID
	HIW - Main effective value
	IND - Index
	BCC - Block Check Character

PWE - Parameter value

# Broadcast with set bit 5 in ADR byte

A request can be directed to a certain slave ore be send to all slaves as broadcast message. For the identification of a broadcast message you have to set bit 5 to 1 in the ADR byte. Here the slave addr. (bit 0 ... 4) is ignored. In opposite to a "normal" send command, the broadcast does not require a telegram evaluation via FC/SFC 218 SER\_RCV. Only write commands may be sent as broadcast.

#### Modbus

- The Modbus protocol is a communication protocol that fixes a hierarchic structure with one master and several slaves.
- Physically, Modbus works with a serial half-duplex connection. There are no bus conflicts occurring, because the master can only communicate with one slave at a time.
- After a request from the master, this waits for a preset delay time for an answer of the slave. During the delay time, communication with other slaves is not possible.
- After a send command, the acknowledgement telegram must be read by a call of the FC/SFC 218 SER\_RCV.
- The request telegrams send by the master and the respond telegrams of a slave have the following structure:

# **Deployment PtP communication**

Protocols and procedures

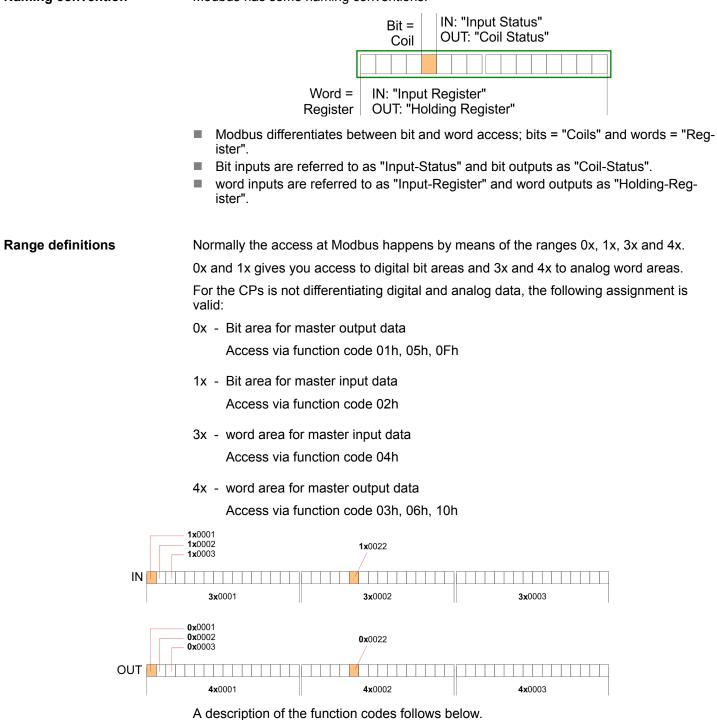

Start sign	Slave address	Function Code	Data	Flow control	End sign			
Broadcast with address = 0		<ul> <li>To mark a broa</li> <li>In opposite to a evaluation via</li> </ul>	be directed to a special slave or at a adcast message, the slave address a "normal" send command, the broa FC/SFC 218 SER_RCV. mands may be sent as broadcast.	0 is used.	-			
ASCII, RTU mode		<ul> <li>Modbus offers 2 different transfer modes. The mode selection happens during runtime by using the FC/SFC 216 SER_CFG.</li> <li>ASCII mode: Every byte is transferred in the 2 sign ASCII code. The data are marked with a start and an end sign. This causes a transparent but slow transfer.</li> <li>RTU mode: Every byte is transferred as one character. This enables a higher data pass through as the ASCII mode. Instead of start and end sign, a time control is used.</li> </ul>						
Supported Mod cols	•	<ul> <li>The following Modbus Protocols are supported by the RS485 interface:</li> <li>Modbus RTU Master</li> <li>Modbus ASCII Master</li> </ul>						

Modbus - Function codes

# 6.8 Modbus - Function codes

Naming convention	
-------------------	--

Modbus has some naming conventions:

#### Overview

With the following Modbus function codes a Modbus master can access a Modbus slave. The description always takes place from the point of view of the master:

Code	Command	Description
01h	Read n bits	Read n bits of master output area 0x
02h	Read n bits	Read n bits of master input area 1x

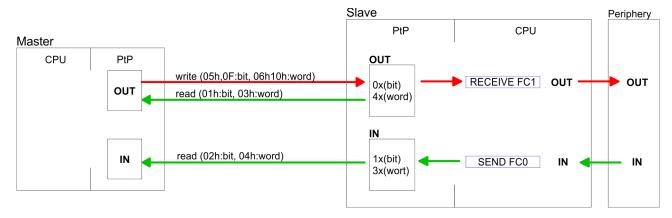

#### **Deployment PtP communication**

Modbus - Function codes

Code	Command	Description
03h	Read n words	Read n words of master output area 4x
04h	Read n words	Read n words master input area 3x
05h	Write 1 bit	Write 1 bit to master output area 0x
06h	Write 1 word	Write 1 word to master output area 4x
0Fh	Write n bits	Write n bits to master output area 0x
10h	Write n words	Write n words to master output area 4x

#### Point of View of "Input" and "Output" data

The description always takes place from the point of view of the master. Here data, which were sent from master to slave, up to their target are designated as "output" data (OUT) and contrary slave data received by the master were designated as "input" data (IN).

#### **Respond of the slave**

If the slave announces an error, the function code is send back with an "ORed" 80h. Without an error, the function code is sent back.

	Slave answer:	Function code OR 80 Function code		$\rightarrow$ Error $\rightarrow$ OK			
				,			
Byte sequence in a word		1 W	ord				
		High-byte	Low-byte				
Check sum CRC, RTU, LRC		ns CRC at RTU and LR are not shown in the da		le are automatically added to			
	every telegram. They	are not shown in the us	ita DIOCK.				
Read n bits 01h, 02h	Code 01h: Read n bit	h: Read n bits of master output area 0x					
	Code 02h: Read n bits of master input area 1x						

Modbus - Function codes

## Command telegram

Slave address	Function code	Address 1. bit	Number of bits	Check sum CRC/LRC
1byte	1byte	1word	1word	1word

## Respond telegram

Slave address	Function code	Number of read bytes	Data 1. byte	Data 2. byte	 Check sum CRC/LRC
1byte	1byte	1byte	1byte	1byte	1word
				max. 250byte	

Read n words 03h, 04h	03h: Read n words of master output area 4x
	04h: Read n words master input area 3x

# Command telegram

Slave address	Function code	Address 1. bit	Number of words	Check sum CRC/LRC
1byte	1byte	1word	1word	1word

## **Respond telegram**

Slave address	Function code	Number of read bytes	Data 1. word	Data 2. word	 Check sum CRC/LRC
1byte	1byte	1byte	1word	1word	1word
				max. 125words	

Write 1 bit 05h	Code 05h: Write 1 bit to master output area 0x
	A status change is via "Status bit" with following values:
	"Status bit" = 0000h $\rightarrow$ Bit = 0
	"Status bit" = FF00h $\rightarrow$ Bit = 1

## Command telegram

# 7 Deployment OPC UA

Please note that the simultaneous use of OPC UA and WebVisu on the same interface is not supported! When attempting to activate them, both servers are stopped and the diagnostic message 0xE989 or 0xE9AB is output.

- With an OPC UA project there is the possibility to configure an OPC UA server on your CPU.
- The configuration of an OPC UA project is only possible with the SPEED7 Studio V1.8.6 and up.
- Since a OPC UA project is only executable by memory card, a memory card (VSD, VSC) of Yaskawa must be plugged. Please note that you must always use a VSC card suitable for your CPU. Chap. 4.16 'Deployment storage media - VSD, VSC' page 119
- If the memory card is removed for a short time, the SF LED gets on. This indicates that a feature is missing and the OPC UA server will quit after 72 hours.
- When the project is transferred from the SPEED7 Studio, the OPC UA project is automatically transferred as TAR file to the inserted memory card.
- The OPC UA server must be activated in the CPU. ♦ Chap. 8.2 'Activate WebVisu functionality' page 220
- The access is made with an OPC UA client via the 'Endpoint URL' of the corresponding interface. The 'Endpoint URL' can be found on the Device web page of the CPU. S Chap. 4.11.1.1.1 'Tab: 'OPC UA'' page 105
- 7.1 General

Term definitions

- OPC Open Platform Communications
  - OPC is an interoperability standard for secure and reliable data exchange in industrial automation.
  - OPC is platform-independent and ensures a seamless flow of information between devices from different manufacturers.
- UA Unified Architecture
  - UA specifies security features and data modelling based on a service-oriented architecture (SOA).

Basics OPC UA > OPC UA

#### Precondition

- SPEED7 Studio from Version V1.8.6
  - The functionality for the OPC UA configuration is integrated in the SPEED7 *Studio*.
- Siemens SIMATIC Manager from version V5.5 and SPEED7 Studio from version V1.8.6
  - The OPC UA configuration is done with the OPC UA Configurator. This is part of the SPEED7 Studio from version V1.8.6.
  - When calling the OPC UA Configurator, the SPEED7 Studio opens with functionality limited to OPC UA configuration.
  - The OPC UA Configurator is to be called from the Siemens SIMATIC Manager as external device tool.
  - To be able to call the OPC UA Configurator as an external device tool, you must first register it in the Siemens SIMATIC Manager. This is done with SPEED7 Tools Integration, which is automatically installed during the installation of the SPEED7 Studio.
  - The OPC UA Configurator is to be called from the Siemens SIMATIC Manager after project creation and online configuration.
  - The OPC UA Configurator automatically imports the data for the OPC UA configuration from the project data of the Siemens SIMATIC Manager.
  - The OPC UA configuration is transferred online from the OPC UA Configurator. The OPC UA Configurator automatically imports the data for the OPC UA configuration from the project data of the Siemens SIMATIC Manager.
- Siemens TIA Portal from version V15.0 and SPEED7 Studio from version V1.8.6
  - The OPC UA configuration is done with the OPC UA Configurator. This is part of the SPEED7 Studio from version V1.8.6.
  - When calling the OPC UA Configurator, the SPEED7 Studio opens with functionality limited to OPC UA configuration.
  - The OPC UA Configurator is to be called from the Siemens TIA Portal as external device tool.
  - To be able to call the OPC UA Configurator as an external device tool, you must first register it in the Siemens TIA Portal. This is done with SPEED7 Tools Integration, which is automatically installed during the installation of the SPEED7 Studio.
  - The OPC UA Configurator is to be called from the Siemens TIA Portal after project creation and online configuration.
  - The OPC UA Configurator automatically imports the data for the OPC UA configuration from the project data of the Siemens TIA Portal.
  - The OPC UA configuration is transferred online from the OPC UA Configurator. The OPC UA Configurator automatically imports the data for the OPC UA configuration from the project data of the Siemens TIA Portal.

# 7.2 Basics OPC UA

## 7.2.1 OPC UA

Standard for data and information exchange	<i>OPC UA</i> defines a common standard for data and information exchange in an <i>'Industry</i> 4.0' environment. Due to the platform independence, the integrated security concept and the data type information supplied with the data, <i>OPC UA</i> provides the basis for machine-readable and cross-level communication.
OPC - Open Platform Communications	<ul> <li>Classic variant not scalable and exclusively for Microsoft Windows<sup>®</sup></li> <li>For each type of data transfer, such as real-time data, history data, interrupts, events, etc., a separate solution with its own semantics is required, such as OPC DA, OPC HDA, OPC A&amp;E, etc.</li> </ul>

- Separate and complex effort required for security settings.
- OPC requires a complex DCOM configuration.
- OPC requires separate complex firewall settings.

System SLIO

Basics OPC UA > Information modeling

OPC UA - Open Platform Communications Unified Architecture	<ul> <li>Scalable and platform-independent communication standard specified in IEC 62541.</li> <li>Standardization of classic OPC specifications with integrated security concept.</li> <li>The OPC UA security concept includes user and application authentication, message signing, and encryption of transmitted data.</li> <li>IP-based, optimized, binary protocol for Internet and firewall communication via one port (4840).</li> <li>With OPC UA, any type of information is available at any time and place for any authorized application and authorized person. For example, raw data and preprocessed information can be transported safely from the sensor and field level to the control system and into the production planning systems.</li> <li>SOA (Service Oriented Architecture) replaces the Microsoft DCOM technology with open, platform-independent protocols with integrated security mechanisms.</li> <li>Communication takes place via standardized services based on the <i>Information model</i> of OPC UA.</li> <li>The services are divided into different task groups.</li> <li>Based on a basic model, arbitrarily complex, object-oriented extensions of the services can be carried out, without affecting interoperability.</li> </ul>
OPC UA server	<ul> <li>An OPC UA server provides information within a network that can be retrieved from an OPC UA client.</li> <li>The data exchange can take place via security certificates, which have to be stored accordingly in the server.</li> <li>The OPC UA server provides basic services such as data exchange or navigation through the address space.</li> <li>The OPC UA configuration is used to define the variables or contents that an OPC UA server should provide.</li> <li>The OPC UA configuration is done via an external tool such as for Yaskawa CPUs the OPC UA Configurator.</li> </ul>
OPC UA client	<ul> <li>OPC UA clients are programs with the following functionality:</li> <li>Read or write access to information of the OPC UA server.</li> <li>Access is controlled by access rights.</li> <li>Execute services on the OPC UA server.</li> </ul>
Communication types	<ul> <li>Client/Server         <ul> <li>An OPC UA client accesses information from the OPC UA server via services, provided by the OPC UA server. Here a fix defined connection is used.</li> <li>Example: OPC UA client retrieves status of an input in the CPU.</li> </ul> </li> <li>Publisher/Subscriber         <ul> <li>A Publisher sends to unknown Subscriber (clients) without a fixed connection.</li> <li>Example: Sensors send data to the cloud.</li> </ul> </li> </ul>

# 7.2.2 Information modeling

Information model

- Information models are used to describe devices and their data.
- The basis is the Core specification. The Core specification describes the structure of the address range and of the services, such as the entry points for the clients in the address space of an OPC UA server.
- In an *information model*, the content of the address space of the OPC UA server is described.

Basics OPC UA > Information modeling

	The Information models are structured in layers. Each higher-order type is based on certain basic rules. Thus, clients who only know the basic rules can still edit complex information models, e.g. navigate through the address space and read or write data variables.
	In the address space, all information is represented by Nodes, which are intercon- nected via references.
	<ul> <li>A node is always an instance of a <i>NodeClass</i>.</li> <li><i>OPC UA</i> offers basic services such as data exchange or navigation through the address space. The services are grouped in <i>Service Sets</i>.</li> </ul>
Node classes	The following NodeClasses are defined in the OPC UA specification:
	<ul> <li>Variable - class of variables</li> <li>Method - class of functions</li> <li>Object - class of objects</li> <li>View - Class of view of a subset of nodes</li> <li>DataType - Class of the data types of the value of a variable</li> <li>VariableType - Class of the data types of a variable</li> <li>ObjectType - class of object types</li> <li>ReferenceType - class of reference types</li> </ul>
Node attributes	Each <i>node</i> consists of attributes and references. Some attributes may also be optional. The following attributes of each <i>NodeClass</i> must be published:
	<ul> <li>NodeID - Unique identifier of a <i>nodes</i> in the <i>address space</i></li> <li>NodeClass - class of <i>node</i> instance</li> <li>BrowseName - name of the <i>node</i> in plain text</li> <li>DisplayName - display name of the <i>Node</i> for the user</li> <li>Description - Description of the <i>node</i> (optional)</li> </ul>
OPC UA services	<ul> <li>OPC UA services are abstract descriptions defined by request and response messages.</li> <li>The available services of an OPC UA server are defined in the server profile and grouped together in service sets.</li> </ul>
Basic service sets	<ul> <li>Discovery Service Set</li> <li>Services for discovering existing servers and endpoints.</li> </ul>
	<ul> <li>SecureChannel Service Set</li> <li>Services for opening and closing secure communication channels.</li> </ul>
	<ul> <li>Session Service Set</li> <li>Services for the client to create and manage a session.</li> </ul>
	NodeManagement Service Set
	<ul> <li>Services for creating and deleting nodes and references.</li> <li>View Service Set</li> </ul>
	<ul> <li>Services for the client to navigate in the address space or in the view.</li> <li>Query Service Set</li> </ul>
	<ul> <li>Services for search queries in the address space.</li> </ul>
	<ul> <li>Attribute Service Set</li> <li>Services for accessing attributes of nodes.</li> </ul>
	<ul> <li>Method Service Set</li> <li>Service for calling a method of an object.</li> </ul>

- MonitoredItem Service Set
  - Services for the client to create and manage monitored items.
  - Monitored items are used to log in for data and event notifications.
- Subscription Service Set
  - Services for the client to create and manage subscriptions.
  - Subscriptions control the way of the data and event notification.

#### Access

- To access an OPC UA server, the *endpoint* must be known.
- You can navigate via the *endpoint* using the navigation function through the address space of the OPC UA server. Here you receive information about the OPC UA server and the CPU and have access to the objects created in the OPC UA configuration, such as tags, data blocks, etc.
- Lower network load through 'subscriptions'
  - If variables are to be transmitted only if their value has changed, you have to use subscriptions.
  - To activate a *subscription*, enter the transmission interval "Publishing Interval" in the *OPC UA* client.
  - When the *subscription* is created, tell the server which variables to monitor.
     Among other things, you can specify the amount by which a value must change in order a transfer takes place.
  - Since only a change in value of a transmission takes place, the use of *subscriptions* leads to a reduced network load.
- Fast access through 'registration'
  - Normally the addressing takes place by means of identifier strings. By using a numeric identifier access can be accelerated. For this reason, you should use the *registration* for regular access to certain variables.
  - During *registration*, the OPC UA client assigns the variable to the OPC UA server. The OPC UA server then generates a numeric identifier and sends it back to the OPC UA client.
  - The numerical identifier is valid for the duration of the session.
  - In the properties of the CPU, you can set the maximum number of registered nodes. This must be taken into account by the OPC UA clients.
  - Since the registration takes time, you should put them in the start-up phase of the OPC UA server.

Due to the system, access to data in complex structures is not consistent.

Setting the sampling intervals (sampling interval, publishing interval) too short may cause too much network load. Always choose intervals that are still sufficient for your application.

#### 7.2.3 OPC UA data types and their conversion

Siemens S7 data types are mapped in the namespace via SPEED7 PLC OPC UA data types. Siemens S7 data types do not always match the OPC UA built-in data types. The CPU provides variables to the OPC UA server as an OPC UA built-in data type so that OPC UA clients can access these variables with OPC UA built-in data types via the server interface. A client can read the "DataType" attribute from such a variable and reconstruct the original data type.

Basics OPC UA > OPC UA data types and their conversion

#### Data type mapping

Siemens S7 data type		SPEED7 PLC OPC UA data type		OPC UA built-in data type
BOOL		BOOL		Boolean
BYTE		BYTE		Byte
WORD		WORD		UInt16
DWORD		DWORD	<b>→</b>	UInt32
INT		INT		Int16
DINT		DINT		Int32
REAL		REAL		Float
S5TIME	÷	S5TIME		UInt16
TIME		TIME	~	Int32
DATE		DATE		UInt16
TIME_OF_DAY (TOD)		TIME_OF_DAY		UInt32
CHAR		CHAR		Byte
COUNTER		COUNTER		UInt16 (Only valid values)
TIMER		TIMER		UInt16 (Only valid values)
STRING		STRING		String
DT		DT		Byte[8]

Particularities

String

- The data type STRING in Siemens S7 is a byte array in which the maximum length and the current length are stored in the first 2 bytes. The other bytes store the string.
  - The OPC UA data type String should be defined in the same way.
- Array
  - A read or write job in *OPC UA* is always an *Array* access, i.e. always provided with index and length.
  - A single variable is a special case of an Arrays (index 0 and length 1). On the line, the data type is simply sent several times in succession. For the variable, the DataType attribute points to the base data type. The ValueRank and ArrayDimensions attributes determine if it is an array and how large the array is.
- Structure
  - A structure describes a complex data type.
  - You can describe your own structures as a subtype of the abstract data type Structures, which inherits from the data type BaseDataType.
  - Since a client may not know user-specific structures, the variables of the data type of this structure are uniformly published in an *ExtensionObject*. The structure *ExtensionObject* can be read by any client and also publishes the *DataTypeId* of the user-specific structure.
  - All structures that are not described by structures of the basic data types are published on the server in a *TypeDictionary*.
  - With the description of the structure by the *TypeDictionary* and the *DataTypeId*, which is published by the *ExtensionObject*, the structure of the *ExtensionObject* can be decoded by a client.
  - If a client knows in advance the description of a user-specific structure, it can be decoded without reading the *TypeDictionary*. In this approach, a client needs to read and decode the entire tree to access individual elements.

## 7.2.4 Integrated security concept

J	· · · · · · · · · · · · · · · · · · ·				
Generals to data security	The topic of data security and access protection have become increasingly important in the industrial environment. The increased networking of entire industrial systems to the network levels within the company together with the functions of remote maintenance have all served to increase vulnerability. Threats can arise from internal manipulation like technical errors, operator and program errors respectively from external manipulation like software viruses and worms, trojans and password phishing.				
	The most important precautions to prevent manipulation and loss of data security in the industrial environment are:				
	<ul> <li>Encrypting the data traffic by means of certificates.</li> <li>Filtering and inspection of the traffic by means of VPN - "Virtual Private Networks".</li> <li>Identification of the nodes by "Authentication" via save channels.</li> <li>Segmenting in protected automation cells, so that only devices in the same group can exchange data.</li> </ul>				
Guidelines for information security	With the "VDI/VDE 2182 sheet 1", Information Security in the Industrial Automation - Gen- eral procedural model, VDI guidelines, the VDI/VDE society for measuring and automa- tion engineering has published a guide for implementing a security architecture in the industrial environment. The guideline can be found at www.vdi.de PROFIBUS & PROFINET International (PI) can support you in setting up security standards by means of the "PROFINET Security Guideline". More concerning this can be found at the corre- sponding web site such as www.profibus.com				
Security mechanisms in OPC UA	<ul> <li>Verifying the identity of OPC UA servers and clients.</li> <li>Checking the identity of the users.</li> <li>Signed and encrypted data exchange between OPC UA server and clients.</li> <li>In the connection settings in the OPC UA Configurator, you can specify how a user of an OPC UA client must legitimize access to the OPC UA server.</li> <li>Safety rules:</li> <li>Only activate 'Anonymous-Login' or 'Unsecured data traffic' in exceptional cases.</li> <li>Only allow access to variables and data blocks via OPC UA if it is actually required.</li> </ul>				
	<ul> <li>Activate only security guidelines that are compatible with the protection concept for your machine or Application. Deactivate all other security guidelines.</li> </ul>				
X.509 certificates	<i>OPC UA</i> has integrated security mechanisms in multiple layers. An important component here are X.509 certificates, which are also used in the PC world. When using certificates, the <i>OPC UA</i> server delivers data to the client only if the security certificate has been accepted as valid on both sides. An X.509 certificate includes the following information:				

- Version and serial number of the certificate.
- Name of the certification authority.
- Information about the algorithm used by the certification authority to sign the certificate.
- Start and end of the validity of the certificate.
- Name of the program, person, or organization for which the certificate was signed by the certification authority.
- The public key of the program, person or organization.

Basics OPC UA > Integrated security concept

*OPC UA* uses three types of X.509 certificates when establishing a client-to-server connection:

- OPC UA application certificates
- OPC UA software certificates
- OPC UA user certificates
- Check when establishing a connection
  - When establishing a connection between client and server, the participants check all information from the certificate that is required to establish integrity.
  - Among other things, the period of validity which is stored in the certificate is checked. Please ensure that the date and time are set correctly for the participants, otherwise no communication can take place.
- Sign and encrypt
  - To avoid tampering, certificates are signed.
  - Within the OPC UA Configurator, you can use the 'Server settings' to import certificates or create and sign them yourself.
- Self-signed certificate
  - Each participant generates his own certificate and signs it.
  - Self-signed certificates are to be transferred to the CPU.
  - From a self-signed certificate no new certificates can be derived.
  - Sample applications: Static configuration with limited number of communication participants.
- CA certificate:
  - All certificates are created and signed by a certification authority.
  - Only the derived and signed certificate of the certification authority is to be transferred to the CPU.
  - The certification authority can generate new certificates. Adding partner devices is possible at any time.
  - Sample applications: Dynamically growing plants.

#### **Digital signature**

- The signature can be used to prove the integrity and origin of a message.
  1. The sender forms a hash value as a check value from the clear message.
  - 2. The hash value and a private key result in the digital signature.
  - **3.** The clear message is sent to the recipient together with the digital signature.
  - **4.** The recipient decrypts the received signature with the public key and thus gets back the original hash value.
  - **5.** The receiver also forms a hash value from the clear message and checks it with the original hash value. The public key and hash method are included in the X.509 certificate.
    - ⇒ If both hash values are identical, sender and clear message were not manipulated.
      - If both hash values are not identical, the clear message was manipulated or falsified during transmission.

#### Encrypting

- X.509 certificates are not encrypted; they are public and anyone can see them.
- Encrypting data prevents unauthorized users from knowing the content.
- When encrypting, the sender encrypts the clear message with the recipient's public key from the X.509 certificate.
- The recipient decrypts the message with his private key. Each owner of the private key can decrypt a received message.

Secure Channel	<ul> <li>OPC UA uses private and public keys to establish secure channels between client and server</li> <li>Once a secure connection is established, the client and server generate a shared private key for signing and encrypting messages.</li> </ul>
Security policies	OPC UA uses the following security policies to protect messages:
	<ul> <li>No security         All messages are unsecured. To use these security policies, connect to a "None" endpoint of a server.     </li> <li>Sign         All messages are signed. This allows the integrity of the received messages to be checked. Manipulations are detected. To use these security policies, connect to a "Sign" endpoint of a server.     </li> <li>Sign &amp; encrypt         All messages are signed and encrypted. This allows the integrity of the received messages to be checked. Manipulations are detected. Due to the encryption, no attacker can read the content of the message. To use these security policies, connect to a "Sign &amp; Encrypt" endpoint of a server.     </li> </ul>
	Example: "Basic256Sha256 - Sign & Encrypt" means: Secure Endpoint, supports a set of algorithms for 256-bit hashing and 256-bit encryption.  Please note that the encryption of the communication can affect CPU performance and therefore the response time of the entire system!

Usage in Siemens SIMATIC Manager > Precondition

# 7.3 Activate OPC UA functionality

Proceeding

For your CPU can process a OPC UA project, you have to activate the OPC UA functionality.

- 1. Insert a Yaskawa memory card (VSD, VSC) into your CPU. Please note that you must always use a VSC card suitable for your CPU. Schap. 4.16 'Deployment storage media VSD, VSC' page 119
- **2.** Turn on the CPU, to activate the OPC UA functionality, you have to establish an Overall reset.
  - ⇒ As long as the memory card is inserted, the OPC UA functionality remains activated even after a power cycle. When the project is transferred from the OPC UA Configurator, the OPC UA project is automatically transferred to the inserted memory card.

Please regard that the memory card must remain plugged when you've executed activated the OPC UA functionality. Otherwise the SF LED is on and the OPC UA functionality is deactivated after 72 hours. As long as an activated memory card is not inserted, the SF LED is on and the "TrialTime" timer counts from 72 hours down to 0. After that the OPC UA functionality is de-activated. By inserting the memory card, the LED goes off and the CPU runs again without restrictions.

Please note that the use of a OPC UA project, depending on the scope of the OPC UA project and the PLC project, can influence the performance and thus the response time of your application.

# 7.4 Usage in SPEED7 Studio

Precondition

- SPEED7 Studio from Version V1.8.6
  - The functionality for the OPC UA configuration is integrated in the SPEED7 Studio. For more information, see the according online help.

# 7.5 Usage in Siemens SIMATIC Manager

7.5.1 Precondition

Siemens SIMATIC Manager from V5.5 and SPEED7 Studio from V1.8.6

- The OPC UA configuration happens by the external OPC UA Configurator.
- The OPC UA Configurator is the SPEED7 Studio reduced to OPC UA functionality.
- The OPC UA Configurator can be registered in the Siemens SIMATIC Manager by means of the SPEED7 Tools Integration.
- The OPC UA Configurator is to be called from the Siemens SIMATIC Manager after project creation and online configuration.
- The OPC UA Configurator automatically imports the data for the OPC UA configuration from the project data of the Siemens SIMATIC Manager.
- The OPC UA configuration is transferred online from the OPC UA Configurator. The OPC UA Configurator automatically imports the data for the OPC UA configuration from the project data of the Siemens SIMATIC Manager.

Usage in Siemens SIMATIC Manager > Installation OPC UA Configurator

$\bigcirc$	
_	
	_

Please note that only the objects of the LD, FBD and IL languages can be transferred to the OPC UA Configurator.

#### 7.5.2 Installation OPC UA Configurator

#### Proceeding

Installation and activation of SPEED7 Studio

The OPC UA Configurator is part of the SPEED7 Studio with OPC UA functionality. With the SPEED7 Tools Integration, which is also installed when installing the SPEED7 Studio the OPC UA Configurator is to be registered in the Siemens SIMATIC Manager as external tool.

**1.** The latest version of the *SPEED7 Studio* can be found in the *'Download Center'* of www.yaskawa.eu.com. Double-click on the installation program an follow the instructions on the monitor.

The use of the SPEED7 Studio requires that you agree with the license agreement. During installation, you must confirm this.

Further components are required in order to operate *SPEED7 Studio*. If the following programs are not already present on your PC, they are automatically installed:

- Microsoft .NET Framework 4.52
- Microsoft SQL Server<sup>©</sup> 2014 SP1
- WinPcap
- 2. You can use a 30-day demo version or activate a license.

In order to use *SPEED7 Studio* without restrictions, you require a licence, which you can obtain from your local Yaskawa customer service organisation.

If the PC, on which you would like to use the *SPEED7 Studio*, is connected to the Internet, you can activate the licence online. If no license is activated, the dialog box for activating the license opens with each new start of *SPEED7 Studio*.

Click on 'Yes'.

- ⇒ The 'Product activation' dialog window will open.
- **3.** Enter the serial number that you received with your order of *SPEED7 Studio* in the *'Licence key'* input field.
- **4.** Enter your name in the 'Your name' input field.
- **5.** If you enter your e-mail address in the *'E-mail address'* input field, you receive an e-mail confirmation regarding the product activation.
- 6. Click at 'Activate'.
  - ⇒ The licence is activated and the SPEED7 Studio is started.

Usage in Siemens SIMATIC Manager > Installation OPC UA Configurator

Registration of SPEED7 Studio in the Siemens SIMATIC Manager as OPC UA Configurator. *SPEED7 Tools Integration* is automatically listed in the Windows Start menu during the installation of the *SPEED7 Studio*.

- To start the SPEED7 Tools Integration, click in the Windows Start menu on 'VIPA ...
   → SPEED7 Tools Integration'.
  - ⇒ For SPEED7 Tools Integration can start, you have to acknowledge the security prompt to change the data on your computer with 'Yes'. Afterwards SPEED7 Tools Integration will be started.

SPEED7 Tools	Integration	×
Integration:		
TIA Portal	SIMATIC Manager	GSDML
Output:		
Information:	Check application configuration file finished	
Help	Log file	Start Close

- 2. Click at 'GSDML ...'.
- 3. Navigate to your GSDML file of your CPU, which you also use for your configuration in the Siemens 'SIMATIC Manager'. Select these and click at 'Confirm'. You can also select and use several GSDML files.
  - ⇒ The identified GSDML files are listed and the selection for the configuration tools is enabled.
- **4.** Select the Siemens 'SIMATIC Manager', in which the SPEED7 Studio is to be registered as OPC UA Configurator.
- 5. Click on 'Start'.
  - ⇒ SPEED7 Studio is registered in the Windows registry as OPC UA Configurator.
    - In the Siemens SIMATIC Manager the OPC UA Configurator is registered as externally callable program.
    - All changes are recorded in a log file, which you can output via 'Log file'.
- 6. **6** 'Close' closes SPEED7 Tools Integration.
  - ⇒ With the next start of the Siemens hardware configurator, the SPEED7 Studio can be called as OPC UA Configurator with to OPC UA configuration limited functions. More information about the usage can be found in the in the online help of the OPC UA Configurator.

## 7.5.3 Steps of the OPC UA configuration

Steps of configuration

When using the Siemens SIMATIC Manager, the OPC UA configuration happens by the following steps:

- **1.** Create your project in the Siemens SIMATIC Manager with the corresponding hardware configuration.  $\Leftrightarrow$  Chap. 4.5 'Hardware configuration - CPU' page 77
- **2.** ► Configure the corresponding Ethernet connection for PG/OP communication and establish an online connection.  $\Leftrightarrow$  Chap. 4.7 'Hardware configuration - Ethernet PG/OP channel' page 80
- 3. Save translate and transfer your project. & Chap. 4.10 'Project transfer' page 99
- 4. Call the external OPC UA Configurator from the Siemens SIMATIC Manager. For this click in the hardware configurator on the CPU and select 'Start Device Tool → VIPA Framework → OPC UA Configurator'.
- 5. Confirm to start an external program with [YES].

- Data exchange between platforms of different vendors
- If you allow access, you permit the exchange of data between OPC UA Configurator and your project data of the Siemens SIMATIC Manager.
  - Ensure that the necessary security guidelines are complied with.
- ⇒ The OPC UA Configurator is started. For the OPC UA configuration, the data is taken from the Siemens SIMATIC Manager project and listed in the table for the OPC UA configuration.

Please note that only the objects of the LD, FBD and IL languages can be transferred to the OPC UA Configurator.

- 6. Configure the OPC UA server and the data for the OPC UA communication.
- **7.** In the OPC UA Configurator switch to the online dialog and transfer the OPC UA configuration. For communication the IP address data are taken from the Siemens SIMATIC Manager project.
  - The OPC UA configuration is now complete. For check you will find information about your OPC UA configuration on the device web page at 'OPC UA'. & Chap. 4.11.1.1.1 'Tab: 'OPC UA'' page 105
- 7.6 Usage in Siemens TIA Portal

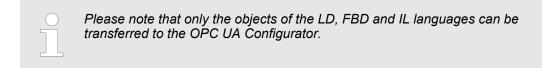

## 7.6.1 Precondition

Siemens TIA Portal from version V15.0 and SPEED7 Studio from V1.8.6

- The OPC UA configuration happens by the external OPC UA Configurator.
- The OPC UA Configurator is the SPEED7 Studio reduced to OPC UA functionality.
- The OPC UA Configurator can be registered in the Siemens TIA Portal by means of the SPEED7 Tools Integration.
- The OPC UA Configurator is to be called from the Siemens TIA Portal after project creation and online configuration.

Usage in Siemens TIA Portal > Installation OPC UA Configurator

- The OPC UA Configurator automatically imports the data for the OPC UA configuration from the project data of the Siemens TIA Portal.
- The OPC UA configuration is transferred online from the OPC UA Configurator. For the communication the OPC UA Configurator automatically uses the IP address data of the Siemens TIA Portal project.

## 7.6.2 Installation OPC UA Configurator

#### Proceeding

Installation and activation of SPEED7 Studio

- The OPC UA Configurator is part of the SPEED7 Studio with OPC UA functionality. With the SPEED7 Tools Integration, which is also installed when installing the SPEED7 Studio the OPC UA Configurator is to be registered in the Siemens TIA Portal as external tool.
  - **1.** The latest version of the *SPEED7 Studio* can be found in the *'Download Center'* of www.yaskawa.eu.com. Double-click on the installation program an follow the instructions on the monitor.

(	С	

The use of the SPEED7 Studio requires that you agree with the license agreement. During installation, you must confirm this.

Further components are required in order to operate *SPEED7 Studio*. If the following programs are not already present on your PC, they are automatically installed:

- Microsoft .NET Framework 4.52
- Microsoft SQL Server<sup>©</sup> 2014 SP1
- WinPcap
- **2.** You can use a 30-day demo version or activate a license.

In order to use *SPEED7 Studio* without restrictions, you require a licence, which you can obtain from your local Yaskawa customer service organisation.

If the PC, on which you would like to use the *SPEED7 Studio*, is connected to the Internet, you can activate the licence online. If no license is activated, the dialog box for activating the license opens with each new start of *SPEED7 Studio*.

Click on 'Yes'.

- ⇒ The 'Product activation' dialog window will open.
- **3.** Enter the serial number that you received with your order of *SPEED7 Studio* in the *'Licence key'* input field.
- **4.** Enter your name in the 'Your name' input field.
- **5.** If you enter your e-mail address in the *'E-mail address'* input field, you receive an e-mail confirmation regarding the product activation.
- 6. Click at 'Activate'.
  - ⇒ The licence is activated and the SPEED7 Studio is started.

Usage in Siemens TIA Portal > Installation OPC UA Configurator

Registration of SPEED7 Studio in the Siemens TIA Portal as OPC UA Configurator *SPEED7 Tools Integration* is automatically listed in the Windows Start menu during the installation of the *SPEED7 Studio*.

- 1. ► To start the SPEED7 Tools Integration, click in the Windows Start menu on 'VIPA ... → SPEED7 Tools Integration'.
  - ⇒ For SPEED7 Tools Integration can start, you have to acknowledge the security prompt to change the data on your computer with 'Yes'. Afterwards SPEED7 Tools Integration will be started.

SPEED7 Tools	Integration	
Integration:		
TIA Portal	SIMATIC Manager	GSDML
Output:		
Information:	Check application configuration file finished	
Help	Log file	Start Close

- 2. Click at 'GSDML ...'.
- 3. Navigate to your GSDML file of your CPU, which you also use for your configuration in the Siemens '*TIA Portal*'. Select these and click at '*Confirm*'. You can also select and use several GSDML files.
  - ⇒ The identified GSDML files are listed and the selection for the configuration tools is enabled.
- **4.** Select 'TIA Portal', in which the SPEED7 Studio is to be registered as OPC UA Configurator.
- 5. Click on 'Start'.
  - ⇒ SPEED7 Studio is registered in the Windows registry as OPC UA Configurator.
    - In the Siemens TIA Portal the OPC UA Configurator is registered as externally callable program.
    - The current Windows user is registered in the user group Siemens TIA Openness of the Siemens TIA Portal.
    - All changes are recorded in a log file, which you can output via 'Log file'.
- **6.** *Close'* closes SPEED7 Tools Integration.
  - With the next start of the Siemens TIA Portal, the SPEED7 Studio can be called as OPC UA Configurator with to OPC UA configuration limited functions. More information about the usage can be found in the in the online help of the OPC UA Configurator.

Usage in Siemens TIA Portal > Steps of the OPC UA configuration

## 7.6.3 Steps of the OPC UA configuration

**Steps of configuration** When using the Siemens TIA Portal, the *OPC UA* configuration happens by the following steps:

- **1.** Create your project in the Siemens TIA Portal with the corresponding hardware configuration.  $\Leftrightarrow$  Chap. 13.3 'TIA Portal Hardware configuration CPU' page 304
- **2.** Configure the corresponding Ethernet connection for PG/OP communication and establish an online connection.  $\Leftrightarrow$  *Chap. 13.4 'TIA Portal Hardware configuration Ethernet PG/OP channel' page 307*
- 3. Save translate and transfer your project. Save transfer' page 328
- **4.** Call the external OPC UA Configurator from the Siemens TIA Portal. For this click at 'Devices & networks' on the CPU and select 'Start device tool'.
  - ⇒ A dialog window opens. Select 'OPC UA Configurator' and click [Start].
- **5.** Ignore the query 'Set interface' with [OK]
  - $\Rightarrow$  The OPC UA Configurator is started.
- **6.** If not yet confirmed, you will now receive an access request in the TIA Portal.

5

Please note that due to the software the access request does not appear in the foreground. To show the access request, you must again bring the Siemens TIA Portal to the foreground. Once the access has been selected, you must again bring the 'OPC UA Configurator' to the foreground.

You have the following options for access:

- *No'*: Deny access the OPC UA Configurator is not started.
- 'Yes': Access is permitted once and the OPC UA Configurator is started.
- 'Yes to all': Access is permitted and the OPC UA Configurator is started. At the next call, the access request is no longer shown.

Allow access with 'Yes' respectively 'Yes to all'.

#### NOTICE!

#### Data exchange between platforms of different vendors If you allow access, you permit the exchange of data between

*OPC UA Configurator* and your project data of the Siemens TIA Portal.

Ensure that the necessary security guidelines are complied with.

For the OPC UA configuration, the data is taken from the Siemens TIA Portal project and listed in the table for the OPC UA configuration.

Please note that only the objects of the LD, FBD and IL languages can be transferred to the OPC UA Configurator.

**7.** Configure the OPC UA server and the data for the OPC UA communication.

Usage OPC UA Configurator > OPC UA Configurator

- 8. In the OPC UA Configurator switch to the online dialog and transfer the OPC UA configuration. For communication the IP address data are taken from the TIA Portal project.
  - ⇒ The OPC UA configuration is now complete. For check you will find information about your OPC UA configuration on the device web page at 'OPC UA'.
     ♦ Chap. 4.11.1.1.1 'Tab: 'OPC UA'' page 105
  - You can use the CMD auto commands OPCUA\_PGOP\_ENABLE and OPCUA\_PGOP\_DISABLE to enable or disable OPC UA. After a power cycle or loading a hardware configuration, the settings are retained. With reset to the factory settings or over all reset, the OPC UA project is set to the default value "enabled". Chap. 4.18 'CMD - auto commands' page 122
- 7.7 Usage OPC UA Configurator

# 7.7.1 OPC UA Configurator

The user interface of the OPC UA Configurator is divided into the following areas:

SPEED7 Studio 100.0.56700 DEV df	COPCUA Rev.56698 PRO - SLIO_V2.6.0.PLC	u	+ A	her-v-pc-pc07

- 1 Menu bar
- 2 Toolbar
- 3 Project tree
- 4 Workspace
- 5 Output area

#### Menu bar

In the menu bar you will find a few general commands on the *OPC UA Configurator*. Further commands can be called up via context menus with the right mouse button, e.g. functions for an object in the project tree.

#### Toolbar

Store OPC UA configuration

Compile OPC UA configuration

2

Usage OPC UA Configurator > Project tree

Transfer OPC UA configuration into the control

Project tree

The *Project tree* gives you access to the *'Device properties'* and to the following areas of the *'OPC UA configuration'*:

- Server settings
- Data access
- User management

# **Workspace** In the *Work space*, you can edit the settings in the following areas of the *OPC UA* configuration:

- Device properties General
  - Information about the CPU such as device name, name and firmware version.
- Device properties Communication
  - Configuration of the interface for data exchange.
  - The IP address data are automatically imported from the project when the OPC UA Configurator is called and can be viewed here.
- Device properties Server configuration
   Administration and interface assignment of the OPC UA server in the Project tree
- Server settings Connection
  - Legitimation of the user for access to the OPC UA server.
  - Port for communication.
  - Security policy for encryption and corresponding exceptions.
- Server settings Certificate
  - Create, view, import or export X.509 ITU-T standard certificate.
  - Re-creating or importing replaces an existing certificate.
- Data access
  - Selection of the variables that can be accessed via OPC UA.
  - Filter option to limit the selection.
- User management
  - Creation of a user list with password and role assignment.

Output area The output area shows information about activities performed and background operations.

7.7.2 Project tree 📃

You can edit the *OPC UA* configuration via the project tree. The project tree contains the *OPC UA* configurations, which you have created. You can create a maximum of two *OPC UA* configurations: One configuration for the CPU and one configuration for the CP (if exists).

- **Show project tree** If the project tree is not shown select '*View* → *Project tree*' or press [*Strg*]+[*Shift*]+[*P*].
- **Show/hide objects** The objects in the project tree are arranged in a tree structure. You can show or hide objects:
  - ∃ Hide all objects ('Project → Collapse project tree')
  - Show all objects ('Project → Expand project tree')
    - Hide slave objects / close folder

Usage OPC UA Configurator > Device properties

Show slave objects / open folder

#### Edit configurations and **OPC UA configuration**

# 7.7.3 Device properties h

7.7.3.1 **Overview** 

> Here you can edit the device name and the comment, perform the communication settings as well as create the OPC UA configuration.

- ▶ Click in the project tree at 'Device properties'.
  - ⇒ The 'Device properties' editor opens.

Communication	
Server Configuration	

The 'Device properties' editor is divided into several sections:

- & Chap. 7.7.3.2 'General device properties' page 209
- & Chap. 7.7.3.3 'Communication settings' page 210
- & Chap. 7.7.3.4 'Server configuration' page 211

#### 7.7.3.2 General device properties

To show or change the device properties, proceed as follows:

🚺 Device properties

⇒ The editor of the 'Device properties' opens.

1. Click in the project tree at 'Device properties'.

**2.** Select the area 'General'.

'Device type'	- Name of the CPU
'Firmware'	- Firmware version of the CPU
'Name'	- Device name: This name is shown in the project tree.
'Author'	- Name of the responsible person who created the device
'Comment'	- Any comment, e.g. an annotation or explanation

Usage OPC UA Configurator > Device properties

Click on the input field and enter any comment, e.g. an annotation or explanation. With the *[Enter]* key, you can add a new line to the input field.

#### 7.7.3.3 Communication settings

The communication settings are used to configure the interface for the data exchange between programming device and destination station. Since the IP address parameters for the *OPC UA* configuration are imported from the project, you simply have to set the interface via which you are connected to the destination station.

- Device properties
- **1.** Click in the project tree at *'Device properties'*.
  - ⇒ The editor of the 'Device properties' opens.
- **2.** Select the area 'Communication settings'.

Active pc interface	ce: Ethernet interface		<ul> <li>Verify conne</li> </ul>	ction
	Accessit	ole partners		
Descention of Con-				
Properties of Ser				
PC interface:				
COM port	<b>.</b>	Baudrate [	115,200 Bit/s *	
CPU interface:	-X2: MPI interface	•	interface configuration	
Properties of eth	ernet interface			
PC interface:	Microsoft	*		
IP address:	192.168.178.22	*		
			-	
CPU interface:	-X4: PG_OP_Ethernet	-	interface configuration	

#### Setting the Ethernet interface

- **1.** *Active PC interface'*: Select 'Ethernet interface'.
- **2.** *PC interface*': Select the network adapter for the communication connection from the list.
  - ⇒ If an IP address is already configured in the network adapter, it is shown under the input field 'IP address'. If necessary, select a different IP address.
- 3. CPU interface': Select the interface of the control from the list.
  - ⇒ Since the IP address is imported from the project, it is shown below the input field.
- **4.** To configure further settings of the interface, click on *'Interface configuration'*.
  - ⇒ The 'Interface properties' dialog window will open.

Usage OPC UA Configurator > Server settings - Connection

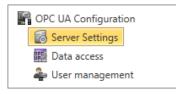

- **5.** In order to check whether a connection between the programming device and the control can be established with the selected communication settings, click on *'Verify connection'*.
  - ⇒ You can see in the status line, whether the connection could be established successfully.
- **6.** In order to check whether your programming device is connected with the correct control, you can retrieve information from the connected control. For this click on 'Accessible partners'.
  - ⇒ The 'Search for accessible partners' dialog window will open.

#### 7.7.3.4 Server configuration

	Here you can create the OPC UA configurations.
Device properties	<b>1.</b> Click in the project tree at <i>'Device properties'</i> .
	$\Rightarrow$ The editor of the <i>'Device properties'</i> opens.
	<b>2.</b> Select the area <i>'Server configuration'</i> .
	You can create a maximum of two <i>OPC UA</i> configurations: One configuration for the CPU and one configuration for the CP (if exists).
Create configuration	1. Select in the selection field 'OPC UA Configuration' and click on 🖶 'Add Server'.
	$\Rightarrow$ A new OPC UA configuration is created and listed in the project tree.
	2. Click in the selection field 'Active server CP' or 'Active server CP' and choose which configuration is to be assigned. With the selection 'None' the configuration remains saved in the project. However, it is not transferred to the device.
	To swap the two configurations for CP and CPU, click on the button 🖑.
	You can create a maximum of two OPC UA configurations.
Remove server	Right-click on the OPC UA configuration (PLC) in the project tree and select 'Remove OPC UA server'.

## 7.7.4 Server settings - Connection 🐻

Here you can perform the connection settings of the OPC UA server.

- **1.** Under Project tree at 'OPC UA configuration' click on 'Server settings'.
  - $\Rightarrow$  The 'Server settings editor' editor opens.
- **2.** Select the area *'Connection'*.

Usage OPC UA Configurator > Server settings - Connection

You can set for the *OPC UA* server how a user of an *OPC UA* client must prove their identity for access to the server. Select at least one of the following login methods. You can also combine the two login methods with each other.

- 'Activate anonymous login'
  - The OPC UA server does not check the authorisation of the OPC UA client.
- 'Activate user/password login'
  - The OPC UA server checks using the user name and password whether the access of the OPC UA client is authorised. To do this, the server evaluates the role assigned to the user. Schap. 7.7.8 'Role management a' page 216'
- Allow obsolete security guideline'
  - Allows the selection of the two obsolete security guidelines 'Basic128Rsa15' and 'Basic256' (not recommended)
- 'Application name'
  - Clear identification of the application in the OPC name space.

Network

General

- 'End point port'
  - TCP port for binary data exchange (standard: 4840).

Security

Activate only security guidelines that are compatible with the protection concept for your machine or system. Deactivate all other security guidelines.

- 'None'
  - Insecure data traffic between server and client.
- 'Basic128Rsa15'
  - Secured data traffic, 128-bit encoding with key wrap algorithm RSA-15, (allow option with 'Allow obsolete security guideline' see above).
- Basic256
  - Secured data traffic, 256-bit encoding (allow option with 'Allow obsolete security guideline' see above).
- 'Basic256Sha256'
  - Secured data traffic, 256-bit encoding with hash algorithm SHA-256 (recommended).

Encoding:

- 'Sign'
  - Endpoint secures the integrity of the data through signing.
- 'SignAndEncrypt'
  - Endpoint secures the integrity and confidentiality of the data through signing and encoding.
- "Both"
  - The OPC UA server offers both encryption methods 'Sign' and

*'SignAndEncrypt'*. The OPC UA client can use one of the two encoding methods.

**Security Check Overrides** Here you can allow various exceptions in the security check, in order to increase the error tolerance.

# 7.7.5 Server settings - Certificate 📾

A secure connection between the *OPC UA* client and the server can only be established if the server classifies and accepts the client's digital certificate as trusted. Currently, the server accepts every valid client certificate. The server accepts self-signed certificates. In addition, the client also checks the server's certificate.

Here you can create, show, import or export an ITU-T standardized X.509 certificate for the *OPC UA* server. The certificate shown here is transferred into the *OPC UA* server.

OPC UA Configuration
🐻 Server Settings
📰 Data access
雥 User management

- **1.** Under Project tree at 'OPC UA configuration' click on 'Server settings'.
  - ⇒ The 'Server settings' editor opens.
- **<u>2.</u>** Select the area 'Certificate'.

The current X.509 certificate is shown in the work space. If you create or import a new certificate, the previously shown certificate is replaced.

#### Toolbar

Toolbal		
	÷	Create new certificate: Opens the dialog window 'Create new certificate'
	Q	Display certificate: Shows information on the current certificate
	0	Export certificate: Opens the dialog window 'Save certificate'
	8	Import certificate: Opens the dialog window 'Open certificate'
Create new certificate		1. Click on 🛃 to create a new certificate.
		⇒ The dialog window 'Create new certificate' opens.
		<b>2.</b> Enter the data for the certificate and click on 'OK'.
		⇒ The previously shown certificate is replaced by the new certificate.
Display certificate		Click on information about the current certificate.
		⇒ The dialog window 'Certificate' opens.
Export certificate		You can export the current certificate e.g. to use it on different computers.
		1. Dick on 🔄
		⇒ The dialog window 'Save certificate' opens.
		2. Select a directory and enter a file name.
		3. Click on 'Save'.
		$\Rightarrow$ The current certificate is saved in the export file (pfx file format).
Import certificate		You can import a certificate, e.g. to use it for the current OPC UA configuration. For a successful import, the certificate must have the following characteristics:
		<ul> <li>The certificate must be available as a PFX file.</li> <li>The <i>'Common name'</i> and <i>'Organization'</i> fields must be completed.</li> </ul>

Usage OPC UA Configurator > Data access

- The maximum key strength must not exceed 2048bit.
- The certificate must contain a valid *Private key*.
- 1. Click at 💽
  - ⇒ The dialog window 'Open certificate' opens.
- **2.** Select the desired certificate (pfx file format).

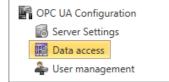

⇒ The editor for 'Data access' opens.

- 3. Click on 'Open'.
  - $\Rightarrow$  The previously shown certificate is replaced by the imported certificate.

# 7.7.6 Data access 📰

Here you can select the variables belonging to the CPU or CP (if exists) that can be accessed via OPC UA.

▶ Under Project tree at 'OPC UA configuration' click on 'Data access'.

**Refresh variables:** Apply changed filter settings to the result table.

Filter settings	Here table	you can select the operands and address ranges that will be shown in the results .
	1.	Activate 💽 'All operand areas' or individual operand ranges to be shown in the result table.
	•	To Barth the end decrease of the end of an end of the end of the stand and barts and decrease

- **2.** To limit the addresses of an operand range, enter the start and end byte addresses in the two adjacent fields, e.g. 0 to 1000.
- 3. ▶ Click on 🔁 or activate 📝 'Apply filter changes immediately'.
  - $\Rightarrow$  The result table is updated with the filter settings.

Result

Toolbar

In the results table, select the variables that are to be used in the OPC UA configuration. OPC UA clients may access these variables.

Activate GPC UA' of the desired variables.

Group operands

For a better overview, you can sort the table entries by groups.

Drag a column header i 3 is 📢 to y Data type 🔤			ent 2he	column.				
		Operandtype	Source	Name	Address	1)ita type	OPC UA 🔽	
	1	Input	Standard Projektkonfiguration	Var_E0.0	1 0.0	BOOL	$\checkmark$	

- (1) Select column (hold left mouse button down)
- (2) Drag the column
- (3) Drop column in the field (release mouse button)
- **1.** Drag the desired column header into the field above the table.
  - $\Rightarrow$  The contents of the column will be grouped. The number of lines is shown for each group.

**2.** Click on  $\blacktriangleright$  to open the group. Click on  $\checkmark$  to close the group.

You can repeat steps 1 to 2 in order to structure the group into further sub-groups. In order to cancel a grouping, click on the close icon next to the group name.

# 7.7.7 User management 🚑

OPC UA Configuration Server Settings Data access The user management allows you to create a user list. For each user, you can define a password and a role. 1. ▶ Under *Project tree* at 'OPC UA configuration' click on 'User management'.

- $\Rightarrow$  The editor for *'User management'* opens.
- **2.** Select the area *'User management'*.

#### Toolbar

- Add new user: Input mode for new user
- Remove user: Deletes the selected user
- Edit current user: Input mode for selected user
- Save input: Save input Save user settings
- Cancel input: Cancel user settings without saving

# Adding a user 1. Click on 🕂.

- 2. Enter the desired user name in the input field 'Name'.
- **3.** Enter the password in the input field *'Password'* and repeat the input under *'Re-enter password'*.
- **4.** Select a role for the user. With this role, the access rights to the *OPC UA* server are established.
- 5. Click on 📊.
  - $\Rightarrow$  The user will be entered in the user list.

Edit user
1. In the user list, select the user whose data you want to change.
2. Click on ∠.
3. Enter the desired changes and click on .

Removing a user

- **1.** In the user list, select the user you want to delete.
- 2. Click on —.
  - A dialog box opens where you can choose whether the user should be deleted or not.

Usage OPC UA Configurator > Output

# 7.7.8 Role management 🌲

Here you establish the roles and access rights that you can assign to the users. When you activate the authentication via User/password login & Chap. 7.7.4 'Server settings - Connection is 'page 211, the access rights to the OPC UA server are issued using the logged-in user and the assigned role.

Example:

Username: "I myself"

Role: Operator

Server settings: User/password login activated

2. Select the area 'Role management'.

The user "Me Self" receives write permission and reading rights to the OPC UA server when he has successfully logged in with the password.

**1.** Under Project tree at 'OPC UA configuration' click on 'User management'.

PC UA Configuration
Configurat

**Configure roles** 

The following two roles are currently available for selection; further roles can not be added at the moment.

Operator: Write permission and reading rights

⇒ The editor for 'User management' opens.

Observer: Reading rights only

# 7.7.9 Output 🗎

Information on executed activities and background operations are displayed in the "Output" window.

#### (1) Delete all messages in the output window

# 8 Deployment WebVisu - Web visualization

Please note that the simultaneous use of OPC UA and WebVisu on the same interface is not supported! When attempting to activate them, both servers are stopped and the diagnostic message 0xE989 or 0xE9AB is output.

- With a WebVisu project there is the possibility to configure a web visualization on your CPU.
- The configuration of a WebVisu project is only possible with the SPEED7 Studio V1.7.0 and up.
- Since a WebVisu project is only executable by memory card, a memory card (VSD, VSC) of Yaskawa must be plugged. Please regard that you always use a VSC card that fits to your CPU. Chap. 4.16 'Deployment storage media - VSD, VSC' page 119
- If the memory card is removed for a short time, the SF LED lights up. This indicates that a feature is missing and the WebVisu will quit after 72 hours.
- The WebVisu functionality must be activated in the CPU. Schap. 8.2 'Activate Web-Visu functionality' page 220
- When the project is transferred from the SPEED7 Studio, the WebVisu project is automatically transferred as TAR file to the inserted memory card.
- Access to the WebVisu project of the CPU happens by the IP address of the Ethernet PG/OP channel and the correspondingly configured port or via the device web page of the CPU.
- You can access your web visualization via a web browser. Web browsers based on Windows CE are currently not supported.

Please note that the use of a WebVisu project, depending on the scope of the WebVisu project and the PLC project, can influence the performance and thus the response time of your application.

#### 8.1 WebVisu editor

The configuration of a *WebVisu* project is shown below. This is only the basic use of the *WebVisu* editor in the *SPEED7 Studio* together with the CPU. Please note that software changes can not always be considered and it may thus be deviations to the description.

For more information on the SPEED7 Studio and how to use the Web-Visu editor, refer to its online help. WebVisu editor > Creating a WebVisu project

# 8.1.2 Creating a WebVisu project

0	
Add WebVisu	<b>1.</b> Start the SPEED7 Studio with your project for the CPU for which a WebVisu project is to be created.
	<b>2.</b> If not already done, add a CPU by clicking 'Add new device'.
	3. Click in the 'Project tree' at the CPU and select 'Context menu → Device properties'.

⇒ The *'Device properties'* of your CPU opens.

#### 4. Here click at 'WebVisu configuration'

⇒ In this settings window, you can create a WebVisu project for your CPU.

🖓 Project tree 🗸 🗸 🗙	General URC_01 ×	
i= := .	bevice properties ×	
<ul> <li>Title: Project solution Project_001 </li> <li>Author: System administrator</li> <li>Project_001 </li> </ul>	General WebVisu configuration

Add new device	WebVisu reafiguration WebVisu:	Visu
Courd Device overview	No WebVisu available	
Device properties		
Device configuration		

A new WebVisu project is created and listed in the 'Project tree'. At 'WebVisu general configurations' and 'WebVisu - SSL configurations', you can make further settings.

WebVisu - general configurations

- Port number
  - Enter the port number under which the WebVisu should be accessible.
  - Port number: 8080 (default): The WebVisu can be accessed via the IP address and port 8080. The Device web page can be accessed via the IP address and port 80.
  - Port number: 80: The WebVisu can be accessed via the IP address and port 80.
     The Device web page can be accessed via the IP address and port 8080.
- Polling interval (ms)
  - Enter here the interval for the cyclical refresh of the web content.
- Execution device
  - Select 'CPU' as device on which this WebVisu project is to be executed.
  - WebVisu projects for Ethernet CPs are not supported by this CPU.

WebVisu - SSL configurations

- Enabling encoding
  - When enabled, you have SSL-encrypted access to your WebVisu.
  - Disable HTTP

- When activated, the access happens via HTTPS.
- SSL port number
  - SSL port number 443 (default): The secure access to the WebVisu takes place via the IP address and port 443. The Device web page can be accessed via the IP address of the CPU and port 8080.
- Original path of the certificate used
  - Here you can upload a security certificate.
  - Only security certificates in PEM format are supported.
  - The file must contain the certificate and the private key.

Delete WebVisu

- Click in the 'Project tree' at WebVisu Project and select 'Context menu → Delete WebVisu'.
  - $\Rightarrow$  The *WebVisu* project is removed from the configuration.

Start-up of the WebVisu project

#### Edit WebVisu

<ul> <li>Web_Visu</li> <li></li> <li>Devices and Networking</li> <li></li> <li></li> <li>PLC_01 [CPU</li> <li></li> </ul>
<ul> <li></li> <li>Devices and Networking</li> <li></li> <li></li> <li>PLC_01 [CPU</li> <li></li> </ul>
🔁 WebVisu Project 🖻 Images
🐻 Main 🚤

- In the 'Project tree', navigate to 'WebVisu Project > Images' and click at 'Main'. Select 'Context menu → Open image'
  - ⇒ The WebVisu editor opens. Here, you can configure your web visualization by dragging and dropping elements from the 'Catalog' onto the editor area and using the 'Properties' to interconnect them with a variable.

# 8.2 Activate *WebVisu* functionality

#### Proceeding

For your CPU can process a *WebVisu* project, you have to activate the *WebVisu* functionality.

- 1. Insert a Yaskawa memory card (VSD, VSC) into your CPU. Please note that you must always use a VSC card suitable for your CPU. Schap. 4.16 'Deployment storage media VSD, VSC' page 119
- **2.** Turn on the CPU, to activate the *WebVisu* functionality, you have to establish an *Overall reset*.
  - ⇒ As long as the memory card is inserted, the *WebVisu* functionality remains activated even after a power cycle. When the project is transferred from the *SPEED7 Studio*, the *WebVisu* project is automatically transferred to the inserted memory card.
    - Please regard that the memory card must remain plugged when you've executed activated the WebVisu functionality. Otherwise the SF LED is on and the WebVisu functionality is deactivated after 72 hours. As long as an activated memory card is not inserted, the SF LED is on and the "TrialTime" timer counts from 72 hours down to 0. After that the WebVisu functionality is de-activated. By inserting the memory card, the LED goes off and the CPU runs again without restrictions.

## 8.3 Start-up of the WebVisu project

The following preconditions must be fulfilled for the WebVisu project to start-up:

- **1.** Activate WebVisu functionality if not already done. *Chap. 8.2 'Activate WebVisu functionality' page 220*
- **2.** Configure your CPU and perform a hardware configuration.
- 3. Configure your WebVisu project.
- **4.** Safe and translate your project.
- **5.** If you are online connected to your CPU, you can transfer your project to the CPU with ' $AG \rightarrow$  Transfer all'.
  - ⇒ Here the configuration is transferred in the CPU and the WebVisu project is transferred to the memory card. Immediately after the transfer you have access to your WebVisu.

Access to the WebVisu > Status of the WebVisu

$\bigcirc$

You can use the CMD auto commands WEBVISU\_PGOP\_ENABLE and WEBVISU\_PGOP\_DISABLE to enable or disable the WebVisu. After a power cycle or loading a hardware configuration, the settings are retained. With reset to the factory settings or over all reset, the WebVisu project is set to the default value "enabled".  $\$  Chap. 4.18 'CMD - auto commands' page 122

#### 8.4 Access to the WebVisu

- When connected via Ethernet PG/OP channel, you have access to the WebVisu and Device web page of the CPU, controlled via ports.
- Access to the WebVisu can be password-protected and encrypted by means of SSL certificates. If you want to use SSL certificates, you must integrate them in the SPEED7 Studio accordingly.
- You can create users in the SPEED7 Studio via 'WebVisu project > User administration', who can access the WebVisu.
- Via 'Device properties > WebVisu configuration' you can specify the port, the Web-Visu can be accessed and upload SSL certificates. This changes the port for accessing the device web page.
  - Port number: 8080 (default): The WebVisu can be accessed via the IP address and port 8080. The Device web page can be accessed via the IP address and port 80.
  - Port number: 80: The WebVisu can be accessed via the IP address and port 80.
     The Device web page can be accessed via the IP address and port 8080.
  - SSL port number 443 (default): The secure access to the WebVisu takes place via the IP address and port 443. The Device web page can be accessed via the IP address and port 8080.

-	Please note that once you have made adjustments to the user man- agement, you will need to restart your web browser. Otherwise you receive system-related error messages about invalid user informa- tion!
-	Please note that the encryption of the communication can affect CPU performance and therefore the response time of the entire system!

#### 8.4.1 Status of the WebVisu

On the device web page at the tab 'WebVisu' via 'Status' you get the status of your WebVisu project. & Chap. 4.11.1.1.2 'Tab: 'WebVisu'' page 106

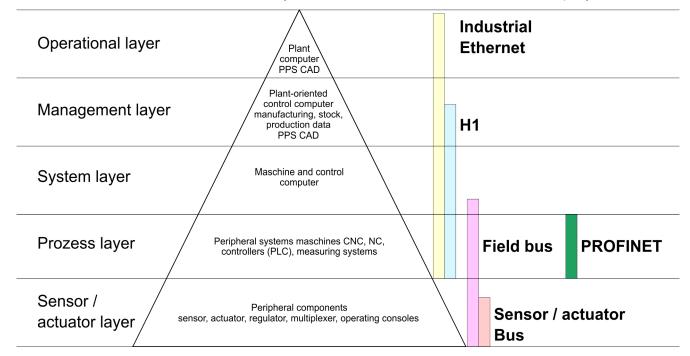

Basics - Industrial Ethernet in automation

# 9 Deployment PG/OP communication - productive

# 9.1 Basics - Industrial Ethernet in automation

#### Overview

The flow of information in a company presents a vast spectrum of requirements that must be met by the communication systems. Depending on the area of business the bus system or LAN must support a different number of users, different volumes of data must be transferred and the intervals between transfers may vary, etc. It is for this reason that different bus systems are employed depending on the respective task. These may be subdivided into different classes. The following model depicts the relationship between the different bus systems and the hierarchical structures of a company:

#### **Industrial Ethernet**

Industrial Ethernet is an electrical net based on shielded twisted pair cabling or optical net based on optical fibre. Industrial Ethernet is defined by the international standard IEEE 802.3

The net access of Industrial Ethernet corresponds to IEEE 802.3 - CSMA/CD (**C**arrier **S**ense **M**ultiple **A**ccess/**C**ollision **D**etection) scheme:

- Every station "listens" on the bus cable and receives communication messages that are addressed to it.
- Stations will only initiate a transmission when the line is unoccupied.
- In the event that two participants should start transmitting simultaneously, they will detect this and stop transmitting to restart after a random delay time has expired.
- Using switches there is the possibility for communication without collisions.

# 9.2 Basics - ISO/OSI reference model

Overview	The ISO/OSI reference model is based on a proposal that was developed by the Interna- tional Standards Organization (ISO). This represents the first step towards an interna- tional standard for the different protocols. It is referred to as the ISO-OSI layer model. OSI is the abbreviation for <b>O</b> pen <b>S</b> ystem Interconnection, the communication between open systems. The ISO/OSI reference model does not represent a network architecture as it does not define the services and protocols used by the different layers. The model simply specifies the tasks that the different layers must perform. All current communication sys- tems are based on the ISO/OSI reference model, which is defined by the ISO 7498 standard. The reference model structures communication systems into 7 layers that cover different communication tasks. In this manner the complexity of the communication between different systems is divided amongst different layers to simplify the task.	
	<ul> <li>The following layers have been defined:</li> <li>Layer 7 - Application Layer</li> <li>Layer 6 - Presentation Layer</li> <li>Layer 5 - Session Layer</li> <li>Layer 4 - Transport Layer</li> <li>Layer 3 - Network Layer</li> <li>Layer 2 - Data Link Layer</li> <li>Layer 1- Physical Layer</li> </ul>	
	Depending on the complexity and the requirements of the communication mechanisms a communication system may use a subset of these layers.	
Layer 1 - Bit communica- tion layer (physical layer)	The bit communication layer (physical layer) is concerned with the transfer of data bits via the communication channel. This layer is therefore responsible for the mechanical, electrical and the procedural interfaces and the physical communication medium located below the bit communication layer:	
	Which voltage represents a logical 0 or a 1?	
	<ul> <li>The minimum time the voltage is present to be recognized as a bit.</li> <li>The pin assignment of the respective interface.</li> </ul>	
Layer 2 - Security layer (data link layer)	This layer performs error-checking functions for bit strings transferred between two com- municating partners. This includes the recognition and correction or flagging of communi- cation errors and flow control functions. The security layer (data link layer) converts raw communication data into a sequence of frames. This is where frame limits are inserted on the transmitting side and where the receiving side detects them. These limits consist of special bit patterns that are inserted at the beginning and at the end of every frame. The security layer often also incorporates flow control and error detection functions. The data security layer is divided into two sub-levels, the LLC and the MAC level. The MAC ( <b>M</b> edia <b>A</b> ccess <b>C</b> ontrol) is the lower level and controls how senders are sharing a single transmit channel. The LLC (Logical Link <b>C</b> ontrol) is the upper level that establishes the connection for transferring the data frames from one device into the other.	
Layer 3 - Network layer	The network layer is an agency layer. Business of this layer is to control the exchange of binary data between stations that are not directly connected. It is responsible for the log- ical connections of layer 2 communications. Layer 3 supports the identification of the single network addresses and the establishing and disconnecting of logical communica- tion channels. Additionally, layer 3 manages the prior transfer of data and the error pro- cessing of data packets. IP (Internet Protocol) is based on Layer 3.	
Layer 4 - Transport layer	Layer 4 connects the network structures with the structures of the higher levels by dividing the messages of higher layers into segments and passes them on to the network layer. Hereby, the transport layer converts the transport addresses into network addresses. Common transport protocols are: TCP, SPX, NWLink and NetBEUI.	

Basics - ISO/OSI reference model

Layer 5 - Session layer	The session layer is also called the communication control layer. It relieves the communi- cation between service deliverer and the requestor by establishing and holding the con- nection if the transport system has a short time fail out. At this layer, logical users may communicate via several connections at the same time. If the transport system fails, a new connection is established if needed. Additionally this layer provides methods for con- trol and synchronization tasks.
Layer 6 - Presentation layer	This layer manages the presentation of the messages, when different network systems are using different representations of data. Layer 6 converts the data into a format that is acceptable for both communication partners. Here compression/decompression and encrypting/decrypting tasks are processed. This layer is also called interpreter. A typical use of this layer is the terminal emulation.
Layer 7 - Application layer	The application layer is the link between the user application and the network. The tasks of the application layer include the network services like file, print, message, data base and application services as well as the according rules. This layer is composed from a series of protocols that are permanently expanded following the increasing needs of the user.

9.3 Basics - Terms	
Network (LAN)	A network res. LAN (Local Area Network) provides a link between different stations that enables them to communicate with each other. Network stations consist of PCs, IPCs, TCP/IP adapters, etc. Network stations are separated by a minimum distance and con- nected by means of a network cable. The combination of network stations and the net- work cable represent a complete segment. All the segments of a network form the Ethernet (physics of a network).
Twisted Pair	In the early days of networking the Triaxial- (yellow cable) or thin Ethernet cable (Cheap- ernet) was used as communication medium. This has been superseded by the twisted- pair network cable due to its immunity to interference. The CPU has a twisted-pair con- nector. The twisted-pair cable consists of 8 cores that are twisted together in pairs. Due to these twists this system is provides an increased level of immunity to electrical interfer- ence. For linking please use twisted pair cable which at least corresponds to the category 5. Where the coaxial Ethernet networks are based on a bus topology the twisted-pair net- work is based on a point-to-point scheme. The network that may be established by means of this cable has a star topology. Every station is connected to the star coupler (hub/switch) by means of a separate cable. The hub/switch provides the interface to the Ethernet.
Hub (repeater)	The hub is the central element that is required to implement a twisted-pair Ethernet net- work. It is the job of the hub to regenerate and to amplify the signals in both directions. At the same time it must have the facility to detect and process segment wide collisions and to relay this information. The hub is not accessible by means of a separate network address since it is not visible to the stations on the network. A hub has provisions to inter- face to Ethernet or to another hub res. switch.
Switch	A switch also is a central element for realizing Ethernet on Twisted Pair. Several stations res. hubs are connected via a switch. Afterwards they are able to communicate with each other via the switch without interfering the network. An intelligent hardware analyses the incoming telegrams of every port of the switch and passes them collision free on to the destination stations of the switch. A switch optimizes the bandwidth in every connected segment of a network. Switches enable exclusive connections between the segments of a network changing at request.

Basics - Protocols

### 9.4 Basics - Protocols

#### Overview

Protocols define a set of instructions or standards that enable computer to establish communication connections and exchange information as error free as possible. A commonly established protocol for the standardization of the complete computer communication is the so called ISO/OSI layer model, a model based upon seven layers with rules for the usage of hardware and software  $\Leftrightarrow$  *Chap. 9.2 'Basics - ISO/OSI reference model' page 223* 

The following protocols are used:

- Siemens S7 connections
- Open communication
  - TCP native according to RFC 793
  - ISO on TCP according to RFC 1006
  - UDP according to RFC 768

**Siemens S7 connections** With the Siemens S7 connection large data sets may be transferred between PLC systems based on Siemens STEP<sup>®</sup>7. Here the stations are connected via Ethernet. Precondition for the Siemens S7 communication is a configured connection table, which contains the defined connections for communication. Here NetPro from Siemens may be used.

Properties:

- A communication connection is specified by a connection ID for each connection partner.
- The acknowledgement of the data transfer is established from the partner station at level 7 of the ISO/OSI reference model.
- At the PLC side product specific FB/SFB handling blocks are necessary for data transfer for the Siemens S7 connections.

More information about the usage of these blocks may be found in the manual "SPEED7 Operation List".

Open communication	In the <i>'open communication</i> ' the communication takes place via the user program by means of handling blocks. These blocks are also part of the Siemens SIMATIC Manager. You will find these in the <i>'Standard Library'</i> at <i>'Communication Blocks'</i> .
	Connection-oriented protocols: Connection-oriented protocols establish a (logical) connection to the communication partner before data transmission is started. And if necessary they terminate the con- nection after the data transfer was finished. Connection-oriented protocols are used for data transmission when reliable, guaranteed delivery is of particular importance. In general, many logical connections can exist on one physical line. The following con-

nection-oriented protocols are supported with FBs for open communication via Industrial Ethernet:

- TCP native accord. to RFC 793:

During data transmission, no information about the length or about the start and end of a message is transmitted. However, the receiver has no means of detecting where one message ends in the data stream and the next one begins. The transfer is stream-oriented. For this reason, it is recommended that the data length of the FBs is identical for the sending and receiving station. If the number of received data does not fit to the preset length you either will get not the whole data, or you will get data of the following job.

- ISO on TCP accord. to RFC 1006:
   During data transmission, information on the length and the end of the message is also transmitted. If you have specified the length of the data to be received greater than the length of the data to be sent, the receive block will copy the received data completely into the receive range.
- Connection-less protocol:

There is thus no establishment and termination of a connection with a remote partner. Connection-less protocols transmit data with no acknowledge and with no reliable guaranteed delivery to the remote partner.

– UDP accord. to RFC 768:

In this case, when calling the sending block you have to specify the address parameters of the receiver (IP address and port number). During data transmission, information on the length and the end of the message is also transmitted. In order to be able to use the sending and receiving blocks first you have to configure the local communications access point at both sides. With each new call of the sending block, you re-reference the remote partner by specifying its IP address and its port number.

#### 9.5 Basics - IP address and subnet

IP address structure	Exclusively IPv4 is supported. At IPv4 the IP address is a 32bit address that must be unique within the network and consists of 4 numbers that are separated by a dot. Every IP address is a combination of a <i>Net-ID</i> and a <i>Host-ID</i> and has the following		
	Structure: xxx.xxx.xxx		
	Range: 000.000.000.000 to 255.255.255.255		
Net-ID, Host-ID	The <b>Net</b> work-ID identifies a network res. a network controller that administrates the net- work. The Host-ID marks the network connections of a participant (host) to this network.		
Subnet mask	The Host-ID can be further divided into a <i>Subnet-ID</i> and a new <i>Host-ID</i> by using a bit for bit AND assignment with the Subnet mask.		
	The area of the original Host-ID that is overwritten by 1 of the Subnet mask becomes the Subnet-ID, the rest is the new Host-ID.		

Basics - IP address and subnet

Subnet mask binary all "1"			binary all "0"
IPv4 address	Net-ID	Host-ID	
Subnet mask and IPv4 address	Net-ID	Subnet-ID	new Host-ID

# Address at first start-up At the first start-up of the CPU, the Ethernet PG/OP channel does not have an IP address.

Information about the assignment of IP address data to the Ethernet PG/OP channel may be found in  $\mathcal{G}$  *Chap. 4.7 'Hardware configuration - Ethernet PG/OP channel' page 80.* 

Address classes For IPv4 addresses there are five address formats (class A to class E) that are all of a length of 4byte = 32bit.

Class A	0 Network-ID		ork-ID	(1+7bit)	Host-ID (24bit)		
Class B	10	Ne	etwork-	-ID (2+14bit)		Host-ID	(16bit)
Class C	110		Netw	ork-ID (3+21bit)			Host-ID (8bit)
Class D	1110		Μ	ulticast group			
Class E	11110	)		Reserved			

The classes A, B and C are used for individual addresses, class D for multicast addresses and class E is reserved for special purposes. The address formats of the 3 classes A, B, C are only differing in the length of Network-ID and Host-ID.

#### **Private IP networks** These addresses can be used as net-ID by several organizations without causing conflicts, for these IP addresses are neither assigned in the Internet nor are routed in the Internet. To build up private IP-Networks within the Internet, RFC1597/1918 reserves the following address areas:

Network class	from IP	to IP	Standard subnet mask
A	10. <u>0.0.0</u>	10. <u>255.255.255</u>	255. <u>0.0.0</u>
В	172.16. <u>0.0</u>	172.31. <u>255.255</u>	255.255. <u>0.0</u>
С	192.168.0. <u>0</u>	192.168.255. <u>255</u>	255.255.255. <u>0</u>

(The Host-ID is underlined.)

#### **Reserved Host-IDs**

Some Host-IDs are reserved for special purposes.

Host-ID = "0"	Identifier of this network, reserved!
Host-ID = maximum (binary complete "1")	Broadcast address of this network

Never choose an IP address with Host-ID=0 or Host-ID=maximum! (e.g. for class B with subnet mask = 255.255.0.0, the "172.16.0.0" is reserved and the "172.16.255.255" is occupied as local broadcast address for this network.)

#### 9.6 Fast introduction

#### Overview

At the first commissioning respectively after an overall reset with PowerON again of the CPU, the Ethernet PG/OP channel has no IP address. This can only be reached by its MAC address. By means of the MAC address, which is printed at the front as *'MAC PG/OP:...'*, you can assign IP address data. The assignment takes place directly via the hardware configuration of the Siemens SIMATIC Manager.

**Steps of configuration** For the configuration of the Ethernet PG/OP channel for productive connections please follow the following approach:

- Hardware configuration CPU
- Hardware configuration Ethernet PG/OP channel
- Configure connections
  - Siemens S7 connections
    - (Configuration via Siemens NetPro, communication via product specific handling blocks)
  - Open communication
    - (Configuration and communication happens by standard handling blocks)
- Transfer of the complete project to CPU

#### 9.7 Hardware configuration

#### Overview

At the first commissioning respectively after an overall reset with PowerON again of the CPU, the Ethernet PG/OP channel has no IP address. This can only be reached by its MAC address. By means of the MAC address, which is printed at the front as *'MAC PG/OP:...'*, you can assign IP address data. The assignment takes place directly via the hardware configuration of the Siemens SIMATIC Manager.

## 9.8 Configure Siemens S7 connections

#### Overview

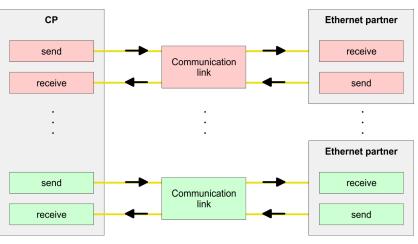

The project engineering of connections i.e. the "link-up" between stations happens in NetPro from Siemens. NetPro is a graphical user interface for the link-up of stations. A communication connection enables the program controlled communication between two participants at the Industrial Ethernet. The communication partners may here be part of the same project or - at multi projects - separated within related part projects. Communication connections to partners outside of a project are configured via the object "In unknown project" or via deputy objects like "Other stations" or Siemens "SIMATIC S5 Station". The communication is controlled by the user program with product specific handling blocks. To use this blocks, configured communication connections are always necessary in the active station.

- ♦ 'Link-up stations' page 231
- ♦ 'Projecting connections' page 232
- ♦ 'Siemens S7 connection Communication functions' page 234

# Properties communication<br/>connectionThe following properties are characterizing a communication connection:One station always executes an active connection establishment.

Bi-directional data transfer (Send and receive on one connection)

- Both participant have equal rights, i.e. every participant may initialize the send res. receive process event controlled.
- Except of the UDP connection, at a communication connection the address of the communication partner is set via the project engineering. Here the connection is active established by one station.

#### Requirements

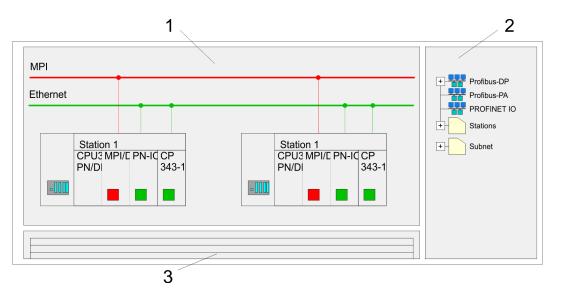

- Siemens SIMATIC Manager V 5.5 SP2 or higher and SIMATIC NET are installed.
- With the hardware configuration the according CP was assigned with IP address data by its properties.

Every station outside of the recent project must be configured as replacement objects like e.g. Siemens "SIMATIC S5" or "other station" or with the object "In unknown project". When creating a connection you may also choose the partner type "unspecified" and set the required remote parameter directly in the connection dialog.

# Work environment of NetPro

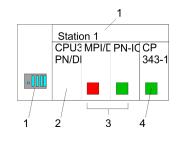

For the project engineering of connections, a thorough knowledge with NetPro from Siemens is required! The following passage only describes the basic usage of NetPro. More detailed information about NetPro is to be found in the according online manual res. documentation. Start NetPro by clicking on a "net" in the Siemens SIMATIC Manager or on "connections" within the CPU.

The environment of NetPro has the following structure:

- 1 Graphic net view: All stations and networks are displayed in a graphic view. By clicking on the according component you may access and alter the concerning properties.
- 2 Net objects: This area displays all available net objects in a directory view. By dragging a wanted object to the net view you may include further net objects and open them in the hardware configurator.
- 3 *Connection table:* The connection table lists all connections in a table. This list is only shown when you highlighted a connectable module like e.g. a CPU. You may insert new connections into this table with the according command.

#### **PLC stations**

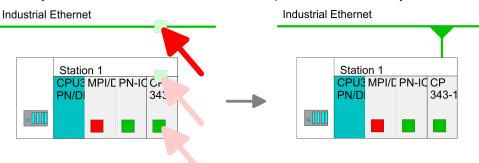

You receive the following graphical display for every PLC station and their component. By selecting the single components, the context menu offers you several functions:

- 1 Station: This includes a PLC station with rack, CPU and communication components. Via the context menu you may configure a station added from the net objects and its concerning components in the hardware configurator. After returning to NetPro, the new configured components are shown.
- 2 *CPU:* A click onto the CPU shows the connection table. The connection table shows all connections that are configured for the CPU.
- 3 Internal communication components: This displays the communication components that are available in your CPU. The PROFINET IO controller is to be configured by the PN-IO component.
- 4 *Ethernet PG/OP channel:* The internal Ethernet PG/OP channel must always be configured as external CP in the hardware configuration.

#### Link-up stations

NetPro offers you the option to link-up the communicating stations. You may link-up the stations via the properties in the hardware configuration or graphically via NetPro. For this you point the mouse on the coloured net mark of the according CP and drag and drop it to the net you want to link. Now the CP is linked up to the wanted net by means of a line.

#### **Projecting connections**

- **1.** For the project engineering of connections, open the connection list by selecting the according CPU. Choose *Insert new connection* in the context menu:
  - Connection partner (partner station)
  - A dialog window opens where you may choose the connection partner and the *connection type*.
  - Specified connection partner Each station configured in the Siemens SIMATIC Manager is listed in the table of connection partner. These stations are unique specified by an IP address and a subnet mask.
  - Unspecified connection partner

Here the connection partner may exist in the *current project* or in an unknown project. Connection jobs to an *unknown project* must be defined by an unique connection name, which is to be used in the projects of both stations. Due to this allocation the connection remains *unspecified*.

- 2. Choose the connection partner and the type of connection and confirm with [OK].
  - ⇒ If activated, a properties dialog for the according connection opens as link to your PLC user program.

Insert new connection
Connection partner
In Project
SIMATIC 300
CPU
Project: Connections Sation: SIMATIC 300
Module: CPU
Connection
Type: S7 connection
OK Apply Cancel

**3.** After every connection was configured by this way, you may save and compile your project and exit NetPro.

Connection types
 With this CPU exclusively Siemens S7 connection may be configured with Siemens NetPro.
 Siemens S7 connection
 For data transfer with Siemens S7 connections the product specific FB/SFB handling blocks are necessary; the deployment is described in the manual "Operation list" of your CPU.
 At Siemens S7 connections the communication connections are specified by a connection ID for each communication partner.
 A connection is specified by the local and partner connection end point.

At Siemens S7 connections the TSAPs must be congruent crosswise. The following parameters define a connection end point:

#### The following parameters define a connection end point:

Station A				Station B
remote TSAP	$\rightarrow$	Siemens	$\rightarrow$	local TSAP
local TSAP	÷	S7 connection	÷	remote TSAP
ID A				ID B

#### Combination options with deployment of the product specific FB/SFB handling blocks

Connection partner	Connection establishing	Connection
specified in NetPro	active/passive	specified
(in the current project)		
unspecified in NetPro	active	specified
(in the current project)	passive	unspecified
unspecified in NetPro	active/passive	specified (connection name in an other
(in the unknown project)		project)

In the following every relevant parameter of a Siemens S7 connection is described:

- Local connection end point: Here you may define how the connection is to be established. Since the Siemens SIMATIC Manager can identify the communication options by means of the end points, some options are already preset and may not be changed.
  - Establish an active connection:
     An established connection is precondition for data transfer. By activating the option Establish an active connection the local station establishes the connection. Please regard not every station is able to establish a connection. Here the job is to be made by the partner station.
- One-way:

If activated only one-way communication blocks like PUT and GET may be used for communication in the user program. Here the partner station acts as server, which neither may send active nor receive active

- Block parameters
  - Local ID:

The ID is the link to your PLC program. The ID must be identical to the ID of the call interface of the product specific FB/SFB handling block.

– [Default]:

As soon as you click at [Default], the ID is reset to system generated ID.

Connection path:

In this part of the dialog window the connection path between the local and the partner station may be set. Depending on the linking of the modules the possible interfaces for communication are listed in a selection field.

[Address details]:

With this button a dialog window is opened, which shows address information about the local and partner station. The parameters may also be changed.

– TSAP:

With Siemens S7 connections a TSAP is automatically generated of the connection resource (one-way/two-way) and state of place (rack/slot respectively system internal ID at PC stations).

Connection resource:

The connection resource is part of the TSAP of the local station respectively of the partner. Not every connection resource may be used for every connection type. Depending on the connection partner and the connection type the range of values is limited respectively the connection resource is fix specified.

Siemens S7 connection - Communication functions

tion - With the SPEED7 CPUs there are two possibilities for the deployment of the communication functions:

- Siemens S7-300 communication functions: By integration of the product specific function blocks FB 12 ... FB 15 you may access the Siemens S7-300 communication functions.
- Siemens S7-400 communication functions: For the Siemens S7-400 communication functions the SFB 12 ... SFB 15 are to be used, which were integrated to the operating system of the CPU. Here copy the interface description of the SFBs from the standard library at system function block to the directory container, generate an instance data block for each call and call the SFB with the associated instance data block.

#### **Function blocks**

FB/SFB	Label	Description
FB/SFB 12	BSEND	Sending data in blocks:
		FB/SFB 12 BSEND sends data to a remote partner FB/SFB of the type BRCV (FB/SFB 13). The data area to be transmitted is segmented. Each segment is sent individually to the partner. The last segment is acknowledged by the partner as it is received, independently of the calling up of the corresponding FB/SFB/FB BRCV. With this type of data transfer, more data can be transported between the communications partners than is possible with all other communication FBs/SFBs for configured S7 connections, namely 65534bytes.
FB/SFB 13	BRCV	Receiving data in blocks:
		The FB/SFB 13 BRCV can receive data from a remote partner FB/SFB of the type BSEND (FB/SFB 12). The parameter R_ID of both FB/SFBs must be identical. After each received data segment an acknowledgement is sent to the partner FB/SFB and the LEN parameter is updated.
FB/SFB 14	GET	Remote CPU read:
		The FB/SFB 14 GET can be used to read data from a remote CPU. The respective CPU must be in RUN mode or in STOP mode.
FB/SFB 15	PUT	Remote CPU write:
		The FB/SFB 15 PUT can be used to write data to a remote CPU. The respective CPU may be in RUN mode or in STOP mode.

## 9.9 Configure Open Communication

#### Handling blocks

Those in the following listed UTDs and FBs serve for "open communication" with other Ethernet capable communication partners via your user program. These blocks are part of the Siemens SIMATIC Manager. You will find these in the "Standard Library" at "Communication Blocks". Please consider when using the blocks for open communication that the partner station does not have to be configured with these blocks. This can be configured with AG\_SEND/AG\_RECEIVE or IP\_CONFIG. First you have to establish a hardware configuration of the CPU and Ethernet PG/OP channel before you can use the handling blocks.

Hardware configuration:

- CPU
  - ♦ Chap. 4.5 'Hardware configuration CPU' page 77
- Ethernet PG/OP channel & Chap. 4.7 'Hardware configuration - Ethernet PG/OP channel' page 80

To specify the Ethernet PG/OP channel, the following values are defined in the UDT 65:

- local\_device\_id
  - 00h: Ethernet PG/OP channel of the CPU
- next\_staddr\_len
  - 01h: Ethernet PG/OP channel of the CPU
- next\_staddr
  - 04h: Ethernet PG/OP channel of the CPU

Configure Open Communication

#### UDTs

FB	Designation	Connection-oriented protocols: TCP native as per RFC 793, ISO on TCP as per RFC 1006	Connectionless protocol: UDP according to RFC 768
UDT 65	TCON_PAR	Data structure for assigning connection parameters	Data structure for assigning parameters for the local communications access point
UDT 66	TCON_ADR		Data structure for assigning addressing parameters for the remote partner

#### FBs

FB	Designation	Connection-oriented protocols: TCP native as per RFC 793, ISO on TCP as per RFC 1006	Connectionless protocol: UDP according to RFC 768
FB 63	TSEND	Sending data	
FB 64	TRCV	Receiving data	
FB 65	TCON	Establishing a connection	Configuring the local communications access point
FB 66	TDISCON	Terminating a connection	Closing the local communications access point
FB 67	TUSEND		Sending data
FB 68	TURCV		Receiving data

More information about the usage of these blocks may be found in the manual "SPEED7 Operation List".

Connection-oriented protocols

- Connection-oriented protocols establish a (logical) connection to the communication partner before data transmission is started.
- And if necessary they terminate the connection after the data transfer was finished.
- Connection-oriented protocols are used for data transmission when reliable, guaranteed delivery is of particular importance.
- In general, many logical connections can exist on one physical line.

The following connection-oriented protocols are supported with FBs for open communication via Industrial Ethernet:

- TCP/IP native according to RFC 793 (connection types 01h and 11h):
  - During data transmission, no information about the length or about the start and end of a message is transmitted.
  - The receiver has no means of detecting where one message ends in the data stream and the next one begins.
  - The transfer is stream-oriented. For this reason, it is recommended that the data length of the FBs is identical for the sending and receiving station.
  - If the number of received data does not fit to the preset length you either will get not the whole data, or you will get data of the following job. The receive block copies as many bytes into the receive area as you have specified as length. After this, it will set NDR to TRUE and write RCVD\_LEN with the value of LEN. With each additional call, you will thus receive another block of sent data.
- ISO on TCP according to RFC 1006:
  - During data transmission, information on the length and the end of the message is also transmitted.
  - The transfer is block-oriented
  - If you have specified the length of the data to be received greater than the length of the data to be sent, the receive block will copy the received data completely into the receive range. After this, it will set NDR to TRUE and write RCVD\_LEN with the length of the sent data.
  - If you have specified the length of the data to be received less than the length of the sent data, the receive block will not copy any data into the receive range but instead will supply the following error information: ERROR = 1, STATUS = 8088h.

#### Connection-less protocol

There is thus no establishment and termination of a connection with a remote partner.
 Connection-less protocols transmit data with no acknowledge and with no reliable guaranteed delivery to the remote partner.

The following connection-oriented protocol is supported with FBs for open communication via Industrial Ethernet:

- UDP according to RFC 768 (with connection type 13h):
  - In this case, when calling the sending block you have to specify the address parameters of the receiver (IP address and port number).
  - During data transmission, information on the length and the end of the message is also transmitted.
  - In order to be able to use the sending and receiving blocks first you have to configure the local communications access point at both sides.
  - With each new call of the sending block, you re-reference the remote partner by specifying its IP address and its port number.
  - If you have specified the length of the data to be received greater than the length of the data to be sent, the receive block will copy the received data completely into the receive range. After this, it will set NDR to TRUE and write RCVD\_LEN with the length of the sent data.
  - If you have specified the length of the data to be received less than the length of the sent data, the receive block will not copy any data into the receive range but instead will supply the following error information: ERROR = 1, STATUS = 8088h.

**Basics PROFINET** 

# 10 Deployment PG/OP communication - PROFINET

- With firmware version V2.4.0, there is a PROFINET IO controller available via the Ethernet PG/OP channel.
   As soon as you use the PROFINET functionality via the Ethernet
  - PG/OP channel, this affects the performance and response time of your system and due to the system the cycle time of the OB 1 is extended by 2ms.

#### 10.1 Basics PROFINET

General

- PROFINET is an open Industrial Ethernet Standard from PROFIBUS & PROFINET International (PI) for automation.
- PROFINET is standardized in the IEC 61158.
- PROFINET uses TCP/IP and IT standards and supplements the PROFIBUS technology for applications, where fast data communication with industrial IT functions is demanded.

There are 2 PROFINET function classes:

- PROFINET IO
- PROFINET CBA

These may be realized in 3 performance steps:

- TCP/IP communication
- RT communication
- IRT communication

PROFINET IO	With PROFINET IO an I/O data sight to the distributed periphery is described.
	PROFINET IO describes the whole data transfer between IO controller and IO device.
	PROFINET is configured like PROFIBUS.
	PROFINET IO always contains the real time concept.
	Contrary to the master-slave procedure of PROFIBUS, PROFINET uses the provider- consumer model. This supports the communication relations (AR = Application Rela- tion) between equal participants in the Ethernet. Here the provider sends its data without a request of the communication partner.
	Apart from the user data exchange also functions for parametrization and diagnostics are supported.
PROFINET CBA	PROFINET CBA means Component Based Automation.
	This component model describes the communication between autonomously working stations.
	It makes a simple modularization of complex plants possible, by distributed intelli- gence by means of graphic configuration for communication of intelligent modules.
TCP/IP communication	This is the open communication via Ethernet TCP/IP without any demand on real-time.
RT Communication	■ RT means <b>R</b> eal- <b>T</b> ime.
	The RT communication represents the basics for data transfer at PROFINET IO.

Here RT data are handled with higher priority.

Basics PROFINET

IRT Communication	<ul> <li>IRT means Isochronous Real-Time.</li> <li>With the IRT communication the bus cycle begins clock-exactly i.e. with a maximum permissible tolerance and is again synchronized. Thereby the time-controlled and synchronous transfer of data is guaranteed.</li> <li>Here sync telegrams of a sync master in the network serve for.</li> </ul>
Properties of PROFINET	<ul> <li>PROFINET of IEC 61158 has the following properties:</li> <li>Full-duplex transfer with 100MBit/s via copper respectively fibre optics.</li> <li>Switched Ethernet</li> <li>Auto negotiation (negotiates the transfer parameters)</li> <li>Auto crossover (transmission and receipt lines are crossed automatically if necessary)</li> <li>Wireless communication via WLAN</li> <li>UDP/IP is used as overlaid protocol. UDP means User Datagram Protocol and contains the unprotected connectionless broadcast communication within IP.</li> </ul>
PROFINET devices	<ul> <li>Like PROFIBUS DP also with PROFINET IO the following devices are classified according to their tasks:</li> <li>IO controller <ul> <li>The <i>IO controller</i> is equivalent to the master of PROFIBUS.</li> <li>This is the PLC with PROFINET connection, in which the PLC program runs.</li> </ul> </li> <li>IO device <ul> <li>The <i>IO device</i> is a distributed I/O field device, which is connected to PROFINET.</li> <li>The IO device is equal to the slave of PROFIBUS.</li> </ul> </li> <li>IO supervisor <ul> <li>The <i>IO supervisor</i> is an engineering station as e.g. programming unit, PC or HMI interface for commissioning and diagnostics.</li> </ul> </li> </ul>
AR	AR ( <b>A</b> pplication <b>R</b> elation) corresponds to a connection to an IO controller or IO supervisor.
API	<ul> <li>API means Application Process Identifier and defines besides <i>Slot</i> and <i>Subslot</i> a further addressing level.</li> <li>With this additional addressing mode with using of different applications, the overlapping of data areas can be prevented.</li> <li>The following APIs are currently supported by the PROFINET IO devices: <ul> <li>DEFAULT_API (0x00000000)</li> <li>DRIVE_API (0x00003A00)</li> <li>ENCODER_API (0x00003D00)</li> <li>FIELDBUS_INTEGRATION_API (0x00004600)</li> <li>PROFINET_IO_LINK_API (0x00004E01)</li> <li>RFID_READER_API (0x00005B00)</li> <li>BARCODE_READER_API (0x00005B10)</li> <li>INTELLIGENT_PUMP_API (0x00005D00)</li> <li>PROCESS_AUTOMATION_API (0x00009700)</li> </ul> </li> </ul>
GSDML file	<ul> <li>To configure a device I/O connection in your own configuration tool, you've got all the information about your PROFINET components in form of a GSDML file. This file may be found for System SLIO in the <i>'Download Center'</i> of <u>www.yaskawa.eu.com</u> under <i>'GSDML SLIO'</i>.</li> <li>Please install the GSDML file in your configuration tool.</li> </ul>

- More information about installing the GSDML file may be found at the manual of the according engineering tool.
- Structure and content of the GSDML file are defined by IEC 61158.

# Addressing In contrast to the PROFIBUS address, in PROFINET each device may be definitely identified with its PROFINET interface:

- Device name
- IP address respectively MAC address

**Transfer medium** PROFINET is compatible to Ethernet in accordance with the IEEE standards. The connection of the PROFINET IO field devices is exclusively established via switches as network components. This is made either as star via multi-port switches or as line by means of switches, integrated to the field devices.

# **10.2 PROFINET installation guidelines**

Generals to data security	The topic of data security and access protection have become increasingly important in the industrial environment. The increased networking of entire industrial systems to the network levels within the company together with the functions of remote maintenance have all served to increase vulnerability. Threats can arise from internal manipulation like technical errors, operator and program errors respectively from external manipulation like software viruses and worms, trojans and password phishing.
Precautions	The most important precautions to prevent manipulation and loss of data security in the industrial environment are:
	Encrypting the data traffic by means of certificates.
	<ul> <li>Filtering and inspection of the traffic by means of VPN - "Virtual Private Networks".</li> <li>Identification of the nodes by "Authentication" via save channels.</li> </ul>
	Segmenting in protected automation cells, so that only devices in the same group can exchange data.
Guidelines for information security	With the "VDI/VDE 2182 sheet 1", Information Security in the Industrial Automation - Gen- eral procedural model, VDI guidelines, the VDI/VDE society for measuring and automa- tion engineering has published a guide for implementing a security architecture in the industrial environment. The guideline can be found at www.vdi.de PROFIBUS & amp; PROFINET International (PI) can support you in setting up security standards by means of the "PROFINET Security Guideline". More concerning this can be found at the corre- sponding web site e.g. www.profibus.com
Industrial Ethernet	<ul> <li>Due to the open standard of PROFINET standard Ethernet components may be used.</li> <li>For industrial environment and due to the high transfer rate of 100MBit/s your PROFINET system should consist of Industrial Ethernet components.</li> <li>All the devices interconnected by switches are located in one and the same network. All the devices in a network can communicate directly with each other.</li> <li>A network is physically limited by a router.</li> </ul>
	If devices need to communicate beyond the limits of a network, you have to configure the router so that it allows this communication to take place.

Deployment as PROFINET IO controller > Steps of configuration

Topology

- Linear
  - With the linear structure all the communication devices are connected via a linear bus topology.
  - Here the linear bus topology is realized with switches that are already integrated into the PROFINET device.
  - If a communication member fails, communication across the failed member is no longer possible.
- Star
  - If you connect communication devices to a switch with more than 2 PROFINET interfaces, you automatically create a star network topology.
  - If an individual PROFINET device fails, this does not automatically lead to failure of the entire network, in contrast to other structures.
  - It is only if a switch fails that part of the communication network will fail as well.
- Ring
  - In order to increase the availability of a network the both open ends of a linear bus topology may be connected by a switch.
  - By configuring the switch as redundancy manager on a break in the network it ensures that the data is redirected over an intact network connection.
- Tree
  - If you interconnect several star structures, you obtain a tree network topology.

## 10.3 Deployment as PROFINET IO controller

10.3.1 Steps of configuration

	<ul> <li>With firmware version V2.4.0, there is a PROFINET IO controller available via the Ethernet PG/OP channel.</li> <li>As soon as you use the PROFINET functionality via the Ethernet PG/OP channel, this affects the performance and response time of your system and due to the system the cycle time of the OB 1 is extended by 2ms.</li> </ul>
$\bigcirc$	Range of functions
	Please regard that the PROFINET IO controller supports only the PROFINET functions, which are described in this manual, even if the Sie- mens CPU, which is used for configuration, offers further functions! To use some described PROFINET functions, it is necessary to deploy another Siemens CPU for configuration. Here, however, is pointed to explicitly.
	guration of the PROFINET IO controller for PROFINET communication should by the following procedure:
<b>1.</b> 🕨 Con	nmissioning and Initialization (assignment IP address data)
2. 🕨 Haro	dware configuration - CPU
<b>3.</b> 🔈 Con	figuration PROFINET IO controller
<b>4</b> . Con	figuration PROFINET IO devices
0	With the Siemens SIMATIC Manager, the System SLIO CPU 013-
	CCE0R00 is to be configured as

CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3)!

HB300 | CPU | 013-CCF0R00 | en | 22-30

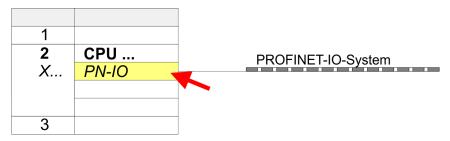

Deployment as PROFINET IO controller > Configuration PROFINET IO controller

10.3.2 Commissionin	g and initialization
Assembly and commis-	1. Install your System SLIO with your CPU.
sioning	<b>2.</b> Wire the system by connecting cables for voltage supply and signals
	3. Connect your PROFINET IO controller with Ethernet.
	<b>4.</b> Switch on the power supply.
	$\Rightarrow$ After a short boot time, the CP is in idle.
	At the first commissioning respectively after an overall reset of the CPU, the PROFINET IO controller and the Ethernet PG/OP channel have no IP address.
Assign IP address param- eters	This function is supported only if the PROFINET IO controller is not yet configured. You get valid IP address parameters from your system administrator. The assignment of the IP address data happens online in the Siemens SIMATIC Manager starting with version V 5.5 & SP2 with the following proceeding:
	<b>1.</b> Start the Siemens SIMATIC Manager.
	2. ▶ Switch to "TCP/IP -> Network card " using 'Options → Set PG/PC interface → '.
	<b>3.</b> Open the dialog for initialization of a station with ' <i>PLC</i> $\rightarrow$ <i>Edit Ethernet node</i> '.
	<b>4.</b> To get the stations and their MAC address, use the [Browse] button or type in the MAC address. The Mac address may be found at the front of the CPU.
	5. Choose if necessary the known MAC address of the list of found stations. To check this with [Blink] you may cause the MT LED to blink.
	<b>6.</b> Either type in the IP configuration like IP address, subnet mask and gateway. Or your station is automatically provided with IP parameters by means of a DHCP server. Depending of the chosen option the DHCP server is to be supplied with MAC address, equipment name or client ID. The client ID is a numerical order of max. 63 characters. The following characters are allowed: Hyphen "-", 0-9, a-z, A-Z
	<b>7.</b> Confirm with [Assign IP configuration].
	Directly after the assignment the PROFINET IO controller is online reachable using the set IP address data. You can take the IP address data to your project by means of the hardware configuration. Schap. 4.5 'Hardware configuration - CPU' page 77
10.3.3 Configuration 10.3.3.1 Precondition	PROFINET IO controller
	<ul> <li>To parametrize the PROFINET IO controller of the CPU, the following conditions must be fulfilled:</li> <li>The PROFINET IO controller is online reachable, this means an initialization was established.</li> <li>The hardware configuration described before was established and the PROFINET IO controller is networked.</li> </ul>
	The PROFINET IO controller supports a maximum IO block size of 512 bytes (consistent).

Proceeding

Open the properties dialog of the PROFINET IO controller by a double-click at PN-IO.

Deployment as PROFINET IO controller > Configuration PROFINET IO controller

The PROFINET interface of the PROFINET IO controller is parametrized with PN-IO, the port with Port 1. In the following these parameters for PN-IO and Port 1 are described.

10.3.3.2 PN-IO	
Tab: 'General'	
Short description	Designation of the IO controller. For the IO controller, the short description is "PN-IO".
Device name	The device name on the Ethernet subnet must be unique. For an integrated PROFINET interface the device name is derived from the short description. You can change this at any time.
Support device replace- ment without exchange- able medium	This parameter is not evaluated. With configured topology the <i>device replacement without exchangeable medium</i> is supported. <i>Schap. 10.7 Device replacement without exchangeable medium/PG' page 255</i>
Properties	With <i>properties</i> you can enter the IP address, subnet mask and gateway for the PROFINET interface and select the subnet to be connected.
Tab: <i>'Addresses'</i>	The CPU reports errors of the IO controller via the <i>interface address</i> , as soon as e.g. an error during synchronization of the IO controller occurs. With the <i>PROFINET IO system address</i> the CPU reports e.g. failure/return of the PROFINET IO system. This address is also used to identify the IO system to which the device belongs, if an IO device fails.
Tab: <i>'PROFINET'</i>	With the operation field "OB82 / I/O fault task" you can cause the CPU to call the OB 82 at an error event of the PROFINET interface. An entry to the diagnostics buffer is always done. The other parameters here are not relevant for the use of the PROFINET CPU.
	Please leave 'Send clock' in Tab 'PROFINET' at 1ms, otherwise this leads to a configuration error!
Tab: <i>'I-Device'</i>	These settings are not required for the use of the PROFINET IO controller as an I-Device and should not be changed.  Schap. 10.4 'Deployment as PROFINET I-Device' page 246
Tab: 'Synchronization'	These settings are not relevant and should not be changed.

Deployment as PROFINET IO controller > Configuration PROFINET IO controller

Tab: <i>'Media Redundancy'</i> (MRP)	MRP is supported exclusively as a <i>redundancy client</i> . & <i>Chap. 10.5 'MRP' page 253</i>
Tab: 'Time-of-day synchronization'	In this area you can configure time-of-day master for time-of-day synchronization in the network. Schap. 4.7.1.1.1 'Time-of-day synchronization' page 83
Tab: 'Options'	
Interval	Here you can set the interval time with which "Keep-Alive" telegrams are to be sent to a connection partner. This ensures that a communication partner can still be reached because the connection resources are automatically released again after the expiration <i>interval</i> time.
10.3.3.3 Port 1	
Tab: <i>'General'</i>	Shown is the short name "Port". In the field Name another designation may be selected, which is also shown in the configuration table At <i>comment</i> you may describe your entry near more. The comment also appears in the configuration table.
Tab: <i>'Addresses'</i>	Via the <i>port</i> address the diagnostics information of the IO controller may be accessed.
Tab: <i>'Topology'</i>	These parameters serve for the port setting for topology & <i>Chap. 10.6 'Topology'</i> page 254
Tab: <i>'Options'</i>	<ul> <li>These parameters serve for the port setting. Here the following parameters are supported:</li> <li>Connection <ul> <li>Here you can make settings for transmission medium and type. Ensure that the setting for the local port and the partner port are identical.</li> <li>PROFINET requires 100Mbit/s in duplex mode.</li> </ul> </li> </ul>
	Please regard that at activated 'Autonegotiation' the communication with a communication partner that has fixed transmission parameters always happens in 'Full-duplex' mode!
	<ul> <li>Boundaries</li> <li>Boundaries are limitations for the transfer of certain Ethernet frames. The following Boundaries are supported: 'End of detection of accessible nodes': DCP frames for detecting accessible</li> </ul>

nodes are not forwarded. When enabled, participants which are lying behind this

'End of topology discovery': When enabled, this port does not support topology

port, are no longer recognized and can not be reached by the controller.

discovery, i.e. LLDP frames are not forwarded.

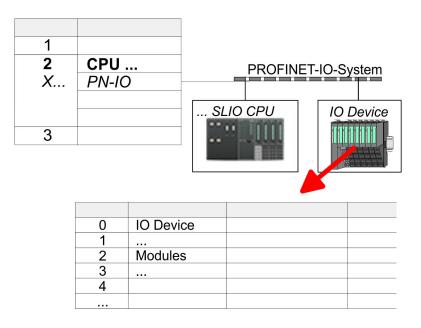

#### 10.3.4 Configuration PROFINET IO device

Precondition

- The modules, which may be configured here are listed in the hardware catalog.
- For the deployment of the System SLIO PROFINET IO devices you have to include the modules into the hardware catalog by means of the product specific GSDML file.
   After the installation of the GSDML file the System SLIO PROFINET IO devices may be found in the hardware catalog at *PROFINET IO* Additional field devices 1/0
  - be found in the hardware catalog at 'PROFINET IO → Additional field devices → I/O → VIPA ... '

**Configure IO devices** Now the project engineering of the PROFINET IO controller is finished. Please link up now your IO devices with periphery to your IO controller.

- **1.** For the project engineering of PROFINET IO device you search the concerning PROFINET IO device in the hardware catalog at *PROFINET-IO* and drag&drop it in the subnet of your IO controller.
- **2.** Assign a name to the IO device. The configured name must match the name of the device. Information about setting the device name can be found in the manual of the IO device.
- **3.** Enter a valid IP address. The IP address is normally assigned automatically by the hardware configurator. If this is not desired, you can assign the IP address manually.
- **4.** Link up the modules of your IO device in the plugged sequence and add the addresses that should be used by the modules.
- **5.** If needed, parametrize the modules.
- 6. Save, compile and transfer your project. & Chap. 4.10 'Project transfer' page 99

Deployment as PROFINET I-Device > Steps of configuration

# 10.4 Deployment as PROFINET I-Device

#### 10.4.1 Steps of configuration

#### Functionality

- With firmware version V2.4.0, there is a PROFINET IO controller available via the Ethernet PG/OP channel.
- As soon as you use the PROFINET functionality via the Ethernet PG/OP channel, this affects the performance and response time of your system and due to the system the cycle time of the OB 1 is extended by 2ms.

#### Range of functions

Please regard that the PROFINET IO controller supports only the PROFINET functions, which are described in this manual, even if the Siemens CPU, which is used for configuration, offers further functions! To use some described PROFINET functions, it is necessary to deploy another Siemens CPU for configuration. Here, however, is pointed to explicitly.

The *I-Device* (Intelligent IO device) functionality of a CPU allows data to be exchanged with an IO controller, which are preprocessed by the CPU. In this case, the I-Device is connected as an IO device to a higher-level IO controller. The process values recorded in central or decentralized periphery can be preprocessed via a user program and made available to the higher-level PROFINET IO controller by means of PROFINET.

- The configuration of the integrated PROFINET IO controller of the System SLIO CPU as an I-Device is made via a virtual PROFINET devices, which is to be installed by means of a product specific GSDML in the hardware catalog.
- The communication takes place via input/output areas, which are defined in the I-Device.
- The size of the areas for input and output data is max. 768byte.
- The I-Device is made available to a deterministic PROFINET IO system via a PROFINET IO interface and thus supports the real-time communication *Real-Time*.
- The I-Device functionality meets the requirements of the RT class I (A) and corresponds to the PROFINET specification version V2.3.
- The configuration of a System SLIO PROFINET CPU as an IO controller and at the same time as an I-Device is possible. The influence of the I-Device configuration on the system limits or performance of the PROFINET controller is equated with that of a device. This means that when the IO controller and I-Device are used at the same time on the PROFINET controller, the I-Device is to be regarded as an additional device for determining the system limits.
- In order for the higher-level IO controller to communicate with the I-Device, the following must be observed:
  - The device name of the PROFINET controller of the I-Device must match the device name of the I-Device at the higher-level IO controller.
  - When using the Siemens SIMATIC manager respectively the TIA Portal you have to configure I-Device and IO-Controller in different logical networks to avoid name conflicts.

The PROFINET IO controller supports a maximum IO block size of 512 bytes (consistent).

Configuration

The configuration of the PROFINET IO controller as I-Device should be done by the following procedure:

- **1.** Installation of the GSDML files
- 2. Configuration as I-Device

Deployment as PROFINET I-Device > Installation of the GSDML files

3. Configuration in the higher-level IO controller

Transfer I-Device from<br/>SPEED7 StudioIf the configuration of the *I-Device* from the SPEED7 Studio is to be applied to the IO con-<br/>troller of a third-party system, then you must export from the SPEED7 Studio the<br/>according GSDLM file and import it into the IO controller of the third-party system.

1. Start the SPEED7 Studio with your PROFINET project.

- 2. Click at the CPU in 'Devices and networking' and select 'Context menu → Create GSDML file'. Specify an 'Export path' and an unique 'Device name'.
  - ⇒ The GSDML file is created and exported. Import this GSDML file into your thirdparty system.

#### 10.4.2 Installation of the GSDML files

The following GSDML files are required for configuring the integrated PROFINET IO controller of the CPU as I-Device in the Siemens SIMATIC Manager:

- GSDML for I-Device
- GSDML for I-Device at IO controller

**Proceeding** The installation of the PROFINET IO device '*SLIO CPU*' happens in the hardware catalog with the following approach:

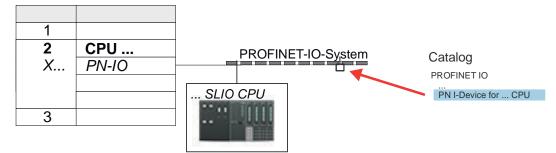

- **1.** Go to the 'Download Center' of www.yaskawa.eu.com.
- **2.** Load under 'GSDML SLIO' the according file for your System SLIO.
- 3. Extract the file into your working directory.
- **4.** ► Start the Siemens SIMATIC Manager and install via 'Options → Install new GSD file' both GSD files.
  - After the installation you can find the following virtual devices in the hardware catalog at 'PROFINET IO → Additional field devices → VIPA ...
    - → ... SLIO System → SLIO I-Device':
    - PN I-Device for System SLIO CPU
      - This allows you to configure the Input/output areas in the I-Device of the CPU.
    - PN I-Device config 013-CCF0R00 for higher-level CPU
      - This allows you to connect the System SLIO I-Device 013-CCF0R00 to the higher-level IO controller.

Deployment as PROFINET I-Device > Configuration as I-Device

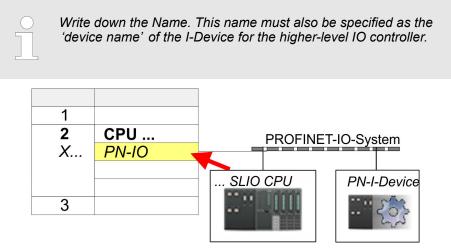

#### 10.4.3 Configuration as I-Device

It is assumed that a hardware configuration of the CPU exists.  $\Leftrightarrow$  Chap. 4.5 'Hardware configuration - CPU' page 77

After installing the GSDML the 'PN I-Device for ... CPU' can be found in the hardware catalog at 'PROFINET IO → Other field devices → I/O → ... SLIO System → SLIO I-Device'. Drag 'PN I-Device for ... CPU' from the hardware catalog to the PROFINET subnet.

**2.** Open the properties dialog of the PROFINET IO controller of the CPU by a doubleclick at *'PN-IO'* and assign a *'Device name'* for the I-Device in the Register *'General'*.

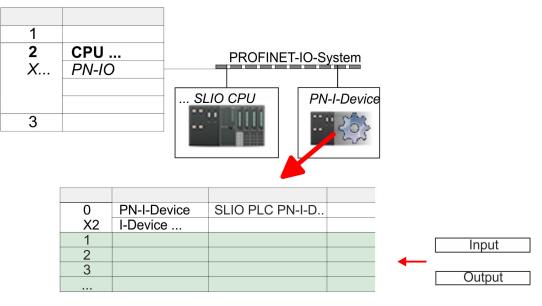

3. For 'PN-IO' at 'slot' 'X...' assign an IP address via the properties dialog.

Deployment as PROFINET I-Device > Configuration in the higher-level IO controller

- **4.** Create the transfer areas by dragging them to the *'slots'* as I/O areas from the hardware catalog. There must be no gaps in the slots. To create the transfer areas, the following input and output areas are available that can be assigned to the virtual I-Device:
  - Input: 1, 8, 16, 32, 64, 128, 256, 512 byte
  - Output: 1, 8, 16, 32, 64, 128, 256, 512 byte

The data direction for Input or Output refers to the view of the I-Device.

- Input areas define data that are sent from the higher-level IO controller to the I-Device and which are mapped to the input address area of the CPU.
- Output areas define data that are sent to the higher-level IO controller and which are to stored in the output address area of the CPU.

#### 10.4.4 Configuration in the higher-level IO controller

It is assumed that a CPU is configured with IP address with the higher-level IO controller. The IP address must be in the same IP circuit as the IP address of the I-Device.

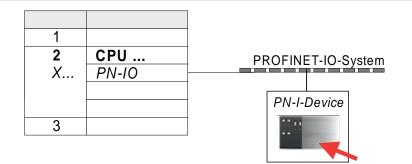

- **1.** Open the project of the CPU with the higher-level IO controller.
- 2. For the project engineering of System SLIO I-Device in the higher-level IO controller you have to search the device '*PN I-Device 013-CCF0R00 for high-level CPU*' in the hardware catalog at *PROFINET-IO* and drag&drop it to the PROFINET subnet.

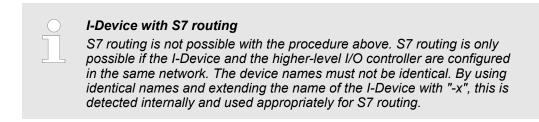

Deployment as PROFINET I-Device > Error behavior and interrupts

3. Open the properties dialog by double-clicking System SLIO '*PN-I-Device*' and enter at '*Device name*' the previously noted name of the I-Device.

- **4.** Configure an input area of the same size for each output area of the I-Device in the IO controller and vice versa. Here also no gaps may arise. In particular, make sure that the order of the transfer areas matches that of the I-Device configuration. The following transfer units are available:
  - Input: 1, 8, 16, 32, 64, 128, 256, 512 byte per slot
  - Output: 1, 8, 16, 32, 64, 128, 256, 512 byte per slot
- **5.** Save and transfer your project to the CPU.
  - ⇒ Your System SLIO PROFINET CPU is now connected as an PROFINET I-Device to the higher-level PROFINET IO controller.

#### 10.4.5 Error behavior and interrupts

#### Error behavior

rior The system shows the following error behavior ...

- ... at gaps in the *'slot'* configuration:
  - If the configuration of the I-Device contains gaps in the 'slot' configuration (i.e. there are free 'slots' before used 'slots'), the configuration is rejected and 0xEA64 is returned as a configuration error in the diagnostic buffer.
  - If the configuration of the higher-level IO controller contains gaps in the 'slot' configuration (i.e. there are free 'slots' before used 'slots'), the connection is rejected with the PN IO Status *ErrorCode1* = 0x40 and *ErrorCode2* = 0x04 (AR\_OUT\_OF\_RESOURCE).
- ... at modules, which differ from the configured:
  - A *ModuleDiffBlock* is generated and the wrong modules are not served.

Deployment as PROFINET I-Device > Error behavior and interrupts

- ... if the number of configured modules in the IO controller is greater than the number of configured modules in the I-Device:
  - The IO controller receives a *ModuleDiffBlock* with ModuleStatus "NoModule" for modules that are not configured in the I-Device. The I-Device sets the status of the non-configured modules to "bad".
- ... if the number of configured modules in the I-Device is greater than the number of configured modules in the IO controller:
  - The IO controller does not receive an error because the additional modules are unknown.

Starting position	IO controller in RUN, I-Device in RUN
Event	I-Device CPU goes to STOP
Reaction	<ul> <li>An OB 85 is called in the IO controller for each input and output transfer area, which is located in the process image, if messages of process image transfer errors are parametrized. 487</li> <li>An OB 122 is triggered in the IO controller for each peripheral direct access to an input or output transfer area.</li> </ul>

Reaction	<ul> <li>The OB 83 (Return-of-Submodule) for input sub modules of the transfer areas to the higher-level IO controller is called in the I-Device.</li> <li>An OB 85 is called for each transfer area, which is located in the process image, in the I-device if messages of process image transfer errors are parametrized and the corresponding OB 83 has not yet been called. <i>§</i> 87</li> <li>An OB 122 is triggered in the I-Device for each peripheral direct access to an input transfer area, until the corresponding OB 83 has been called.</li> <li>The OB 100 (startup) is called in the IO controller.</li> </ul>

MRP

10.5	MRP					
Overview		To increase the network availability of an industrial Ethernet network, you can connect a <i>line topology</i> together to a <i>ring topology</i> . To set up a ring topology with media redundancy, you have to bring together the two free ends of a linear bus topology in one device. Closing the linear bus topology to form a ring is achieved with two ports (ring ports) of a device in the ring. At least one device of the ring takes the role of the <i>redundancy manager</i> . All other devices in the ring are <i>redundancy clients</i> . A standard media redundancy method is MRP (Media Redundancy Protocol). Up to 50 devices per ring can participate. The MRP (Media Redundancy Protocol) is specified in the standard IEC 61158 Type 10 "PROFINET".				
		Precondition				
		The ring in which you want to use MRP may consist only of devices that support this function.				
		"MRP" must be activated for all devices in the ring.				
		All devices must be connected via their ring ports.				
		The ring may contain max. 50 devices.				
		The connection setting (transmission medium/duplex) must be set to "full duplex" and at least 100Mbit/s for all ring ports. Otherwise there may be a loss of data traffic.				
Functio	n	The data paths between the individual devices are automatically reconfigured if the ring is interrupted at any point. After reconfiguration, the devices are accessible again.				
		In the redundancy manager, one of the both ring ports are blocked for uninterrupted network operation for normal communication so that no data telegrams are circulated. In terms of data transmission, the ring topology is a linear bus topology.				
		The redundancy manager monitors the ring for interruptions. For this he sends test frames from both ring port 1 and ring port 2. The test frames run through the ring in both directions until they arrive at the other ring port of the redundancy manager.				
		As soon as the interruption is removed, the original transmission paths are restored, the two ring ports of the redundancy manager are disconnected and the redundancy clients informed of the change. The redundancy clients then use the new paths to the other devices.				
Reconfi	guration time	The time between the ring interruption and restoration of a functional linear topology is known as the <i>reconfiguration time</i> . At <i>MRP</i> the <i>reconfiguration time</i> is typically 200ms.				
PROFINET CP as redun- dancy client		MRP exclusively supported as <i>redundancy client</i> . If the ring is opened or closed, you will be informed via the OB 82 "Neighbourhood change". With SFB 54 you can get more information.				
		The use of MRP in the operating mode I-Device is not permissible and is rejected during the configuration!				

Topology

# 10.6 Topology

#### Overview

By configuring the topology you specify for the PROFINET IO controller the physical connections between the stations in your PROFINET IO system These "neighbourhood relations" are used among others at "Device replacement without exchangeable medium". Here by comparison of target and current topology, the IO device without a name is detected and automatically integrated to the user data traffic. By configuring the topology you have the following options:

- You can evaluate topological errors in your application program
- You have greater flexibility in planning and expansion of a plant

#### Support Topology editor is limited

Please consider that the support for the topology editor of the Siemens SIMATIC Manager is limited. Here you have only the possibility to configure the target topology offline. An online matching is currently not possible. An interconnection of the ports is also possible by means of the port properties!

# Interconnection by means of the *Port* properties

1. Click in the hardware configurator at the according PROFINET port and open the properties dialog via 'Context menu → Object properties' and select the register 'Topology'.

- $\Rightarrow$  The properties dialog to interconnect the ports is opened.
- **2.** Here you have the following parameters:
  - Port interconnection
    - Local port: Name of the local port
    - Medium: Specifying the line type (copper, fibre optic cable). Currently, this
      parameter is not evaluated.
    - Cable name Specifying a cable name
  - Partners
    - Partner port: Name of the port to which the selected port is interconnected.
    - Alternating partner ports: By specifying at 'Partner port' "Any partner", you can configure alternating partner ports for the I/O devices. Currently, this parameter is not evaluated.
  - Cable data
    - Cable length: Depending on the port medium you can set in the select list the cable length, if the medium between two stations does not change. Here the signal delay time is automatically calculated. Currently, this parameter is not evaluated.
    - Signal delay time: If the medium between two stations changes, a signal delay time can be defined here. Currently, this parameter is not evaluated.
- 3. Close the properties dialog with [OK] again.

# 10.7 Device replacement without exchangeable medium/PG

Overview	IO devices, which support the PROFINET function <i>Device replacement without exchangeable medium/PG</i> get their device name from the controller with the exchange. These can be replaced without installing an "exchangeable medium" (memory card) with the stored device name respectively without assigning a device name by a PG. To assign the device name the IO controller uses the configured <i>Topology</i> and the "neighbourhood relationship", which is determined by the IO devices.				
	Thus the <i>Device replacement without exchangeable medium/PG</i> is possible, the following requirements must be met:				
	The Topology of your PROFINET IO system with the corresponding IO devices must be configured.				
	The IO controller and the respective adjacent to the unit to be replaced IO device must support the functionality Device replacement without exchangeable medium/PG.				
	In the IO controller in the 'Properties' the option Support device replacement without exchangeable medium must be enabled.				
	The replaced device must be reset to delivery state, before.				
Configuring the function	The configuration of the function <i>Device replacement without exchangeable medium/PG</i> in your PROFINET IO system happens with the following approach:				
	<ol> <li>Double-click at the PROFINET interface of the IO controller of the CPU.</li> </ol>				
	⇒ The properties dialog of this PROFINET interface is opened				
	<b>2.</b> Enable in the register 'General' the option 'Support device replacement without exchangeable medium'.				
	<b>3.</b> Apply the settings with [OK].				
	<b>4.</b> Safe and translate the hardware configuration.				
	5. 🕞 Configure your Topology. 🏷 Chap. 10.6 'Topology' page 254				
	<b>6.</b> Transfer your project to the CPU.				
Prepare the replace device	For the replacement the "replace device" must be in "delivery state". If you have not received a new "replace device" from Yaskawa, you have to prepare this with the fol- lowing approach:				
	<b>1.</b> For this connect your "replace device" local at your PG.				
	2. ▶ Start the Siemens SIMATIC Manager and execute 'PLC → Edit Ethernet node'				
	<b>3.</b> Click at 'Nodes accessible online' at [Browse].				
	<b>4.</b> Select the according IO device, which you identify as your "replace device".				
	5. Click at 'Reset to factory settings' at [Reset].				
	$\Rightarrow$ Your IO device is now reset and has then "delivery state".				
Replace device	For the replacement the "replace device" must be in "delivery state".				
	<b>1.</b> Disconnect if not already done your device to be exchanged from power.				
	2. Replace this by your "replace device".				
	3. Connect the "replaced device" to power and turn it ON.				
	Here by comparison of target and current topology, the "replaced device" is automatically detected by the IO controller and automatically integrated to the user data traffic.				

Commissioning and start-up behavior

# 10.8 Commissioning and start-up behavior

Start-up on delivery state	In the delivery state the CPU is overall reset. After power ON the PROFINET part has no configuration the PROFINET has no configuration and the LEDs of the PROFINET part are off. The PROFINET part is passive and can be found by the device search.
Online with bus parame- ters without project	<ul> <li>For the communication between IO controller and IO device the ways for the communication are to be defined before. For the clear specification of the communication ways, these are established during the start-up by the IO controller, based on the project data. Here the configuration takes place by a hardware configuration.</li> <li>As soon as the project data were transmitted, the IO controller performs a new system start-up.</li> <li>In this state the IO controller may be accessed and its CPU may be configured via Ethernet by the IO controller by means of the IP address.</li> </ul>
IO device configuration	<ul> <li>The PROFINET IO controller is configured by a hardware configuration. After the transmission of the project into the IO controller, the IO controller has the whole information for the addressing of and the data exchange with the IO devices.</li> <li>During the system start-up of the IO controller the IO devices are supplied with their configured IP address by means of the DCP protocol. After PowerON and after transmitting a new hardware configuration, due to the project data the system start-up of the IO controller is initialized and it runs automatically. During the system start-up the IO controller establishes a clear communication relation (CR) and an application relation (AR) to an IO device. Here the cyclic IO data, the acyclic R/W services and the expected modules/sub modules are specified.</li> <li>The PROFINET IO controller does not have any physical LEDs to show the status. The status information are stored as virtual LED states. During runtime, you can determine their status using the SSL partial lists xy19h or xy74h. <i>© Chap. 10.9.5 'Diagnostics status indication via SSLs' page 259</i></li> <li>The BF2 LED is on when a PROFINET IO device is configured as "linked" but o bus cable is connected.</li> <li>If the IO controller has received a valid configuration with at least one IO device, the BS2-LED glashes at 1Hz.</li> <li>If the IP address of the IO controller can not be used because e.g. it is duplicated, the BS2-LED flashes at 0.5Hz.</li> <li>If at least one IO device is not in cyclic data exchange after the start-up, the BF2 LED binks.</li> <li>If all IO devices are in cyclic data exchange, the BF2 LED gets off. After a successful system start-up the system is ready for communication.</li> </ul>
CPU state influences the IO process data	<ul> <li>After PowerON respectively a receipt of a new hardware configuration the configuration data are automatically transferred to the IO controller. Dependent on the CPU state the following behavior is shown by the IO controller:</li> <li>Behavior at CPU STOP <ul> <li>In the STOP state of the CPU an output telegram is further cyclically sent, but the contained data are marked as "invalid" and as output data zeros are transmitted.</li> <li>The IO controller further receives the input data of the IO devices and transfers them cyclically to the input area of the CPU.</li> </ul> </li> <li>Behavior at CPU RUN <ul> <li>The IO controller cyclically reads the output data from the CPU and transfers these as telegram to the configured IO devices.</li> <li>The IO controller receives the input data of the IO devices and transfers these as telegram to the configured IO devices.</li> </ul> </li> </ul>

PROFINET diagnostics > Diagnostics with the configuration and engineering tool

## **10.9 PROFINET diagnostics**

10.9.1 Overview

There are the following possibilities to get diagnostics information from your system:

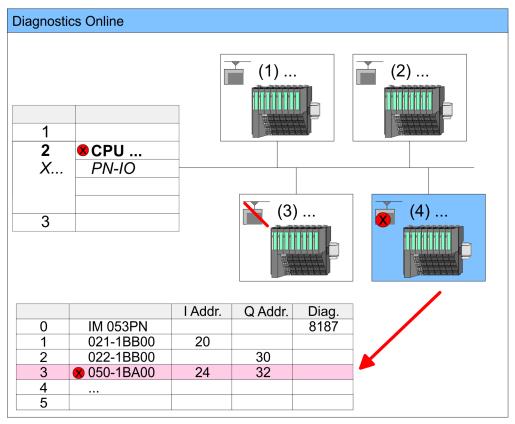

- Diagnostics with the configuration and engineering tool
- Diagnostics during runtime in the user program (OB 1, SFB 52)
- Diagnostics via OB start information
- Diagnostics status indication via SSLs

## **10.9.2** Diagnostics with the configuration and engineering tool

If you are connected from your configuration respectively engineering tool via Ethernet with the PROFINET IO controller, online diagnostics information may be accessed.

E.g. with 'Station  $\rightarrow$  Open online' you get information about the state of your system. Here missing respectively faulty components are shown by symbols.

In the following figure e.g. there is shown that the configured device 3 is missing and device 4 reports an error.

PROFINET diagnostics > Diagnostics during runtime in the user program

#### 10.9.3 Diagnostics during runtime in the user program

With SFB 52 RDREC (read record) you can access diagnostics data from your user program e.g. in OB 1. The SFB 52 RDREC operates asynchronously, that is, processing covers multiple SFB calls.

More information about the usage of this block may be found in the manual "SPEED7 Operation List".

**Example OB 1** For the cyclic access to the diagnostics data of the System SLIO counter module 050-1BA00 the following example may be used in the OB 1:

AN M10.1 'there is S M10.1 'start tr	reading terminated (BUSY=0) and s no job triggered (REQ=0) then cansfer of record (REQ:=1) per of record set (0x4000)
CALL SFB 52, DB52	'Call SFB 52 with Instance DB
REQ :=M10.1	'Trigger flag
ID :=DW#16#0018	'Smaller addr. of mixed module
INDEX :=MW12	
MLEN :=14	'Length record set 0x4000
	'with 1 entry
VALID :=M10.2	'Validity of the record set
BUSY :=M10.3	'Flag job just running
ERROR :=M10.4	'Error bit during read access
STATUS :=MD14	'Error codes
LEN :=MW16	'Length of the read record set
RECORD :=P#M 100	0.0 Byte 40
	'Target (MB100, 40byte)
U M10.1	
R M10.1	'Reset REQ

*Diagnostics data* The counter module 050-1BA00 serves for 20byte diagnostics data. The diagnostics data of the System SLIO module 050-1BA00 have the following structure:

Name:	Bytes	Function	Default
ERR_A	1	Diagnostics	00h
MODTYP	1	Module information	18h
ERR_C	1	reserved	00h
ERR_D	1	Diagnostics	00h
CHTYP	1	Channel type	76h
NUMBIT	1	Number diagnostics bits per channel	08h
NUMCH	1	Number channels of the module	01h
CHERR	1	Channel error	00h
CH0ERR	1	Channel-specific error	00h
CH1ERRCH7ERR	7	reserved	00h
DIAG_US	4	µs ticker	00h

PROFINET diagnostics > Diagnostics status indication via SSLs

C	$\mathbf{)}$

More information about the diagnostics data may be found in the System SLIO manual HB300\_FM\_050-1BA00.

### 10.9.4 Diagnostics via OB start information

- On an error the faulty system generates a diagnostics message for the CPU. Then the CPU calls the according diagnostics OB. Here the CPU operating system transfers start information to the local data of the OB.
- By evaluating the start information of the according OB you can get information about cause and location of the error.
- During runtime you can access the start information with the system function SFC 6 RD\_SINFO.
- Please consider that you can even read the start information in the OB himself, because the data are temporary data.

Depending on the type of error, the following OBs are called in a diagnostics event:

- OB 82 on an error of an module at the IO device (Diagnostics interrupt)
- OB 83 on inserting respectively removing a module on a IO device
- OB 86 on failure respectively return of a IO device

More information about the OBs and their start information may be found in the online help of your programming tool and in the manual "SPEED7 Operation List".

#### 10.9.5 Diagnostics status indication via SSLs

The PROFINET IO controller does not have any physical LEDs to show the status. The status information are stored as virtual LED states. During runtime, you can determine their status using the SSL partial lists xy19h or xy74h. More can be found in the manual "SPEED7 Operation List".

#### Virtual LEDs PROFINET

BF3	BS2	MT2	Meaning
(bus error)	(Bus status)	(Maintenance)	
			PROFINET is not configured.
	•		PROFINET is configured with valid Ethernet interface parameter, valid IP address and at least one IO device.
•	Х	Х	<ul> <li>Bus error, no connection to sub net/switch.</li> <li>Wrong transfer rate</li> <li>Full-duplex-transmission is not activated.</li> </ul>
ZHz	x	x	<ul> <li>Failure of a connected IO device.</li> <li>At least one IO device is not access-able.</li> <li>Faulty configuration</li> <li>I device is configured, but no connection exists yet.</li> </ul>

PROFINET diagnostics > Diagnostics status indication via SSLs

BF3	BS2	MT2	Meaning
(bus error)	(Bus status)	(Maintenance)	
х	IHz	х	<ul> <li>Ethernet interface parameter are not valid.</li> <li>I-Device is configured and <i>Link mode</i> does not correspond to <i>'100 Mbps full duplex'</i>.</li> </ul>
Х	0.5Hz	Х	There was no IP address assigned.
Х	Х	•	Maintenance event of an IO device is pending respectively an internal error happened.
s on, 1s off	Х	4s on, 1s off	Simultaneous blinking indicates a not valid configuration.
AHz		Hz	The alternate blinking indicates that a firmware update of the PROFINET IO controller is executed.
			Firmware update of the PROFINET IO controller is finished without error.
X	Х	ZHz	With a suited configuration tool you can cause the MT LED to blink by means of the function <i>'Member blink test'</i> . This can be useful for e.g. identification of the module.
on: 🚺   off: 🔄   t	olinking: 🗾   not re	elevant: X	
Deployment BS status		<ul> <li>BS LED: blin         <ul> <li>Ethernet</li> </ul> </li> <li>BS LED: blin         <ul> <li>There was</li> </ul> </li> <li>BS LED: on         <ul> <li>PROFIN</li> </ul> </li> </ul>	ET is not configured. ks with 1Hz interface parameter are not valid. ks with 0.5Hz as no IP address assigned. ET is configured with valid Ethernet interface parameter, valid IP address ast one IO device.

As uited configuration tool you can cause the LED to blink by means of the <i>'Member blink test'</i> . This can be useful for e.g. identification of the eous blinking together with BF2 LED (4s on, 1s off) indicates that the ation is invalid. mate blinking with BF2 LED with 4Hz indicates that a firmware update of FINET IO controller is executed.

## **10.10 PROFINET system limits**

Maximum number devices and configurable connections

$$D = \sum_{i=1}^{n} \frac{1}{A_i}$$

Based on the devices, which have to communicate with the IO controller per ms, you can determine the maximum number of devices. This also results in the maximum number of configurable connections. The *Devices per ms* can be determined by the sum formula of the individual refresh times (A).

- D Devices per ms
- n Number of devices
- A Refresh time device

Ple sm

Please note that the value D must always be rounded to the nearest smaller integer!

#### The PROFINET IO controller has the following system limits

<b>U</b>			
Devices per ms (D)	Max. number of devices	Max. number of configu- rable connections	
8	32	0	
7	32	2	
6	64	2	
5	96	2	
4	128	2	
3	128	2	
2	128	2	
1	128	2	
0	0	2	

#### Output bytes per ms

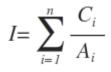

$$O = \sum_{i=1}^{n} \frac{B_i}{A_i}$$

- O Output bytes per ms
- n Number of devices
- B Number output bytes per device
- A Refresh time per device

The PROFINET IO controller has the following system limits:

- Max. Number output bytes per ms: 800
- Max. Number output bytes per device: 768

#### Input bytes per ms

- I Input bytes per ms
- n Number of devices
- C Number input bytes per device
- A Refresh time per device

The PROFINET IO controller has the following system limits:

- Max. number input bytes per ms: 800
- Max. number input bytes per device: 768

Fast introduction

# 11 *Option:* Deployment PROFIBUS communication

# **11.1 Fast introduction**

Overview

The PROFIBUS DP slave is to be configured in the hardware configurator from Siemens. Here the configuration happens by the sub module X1 (MPI/DP) of the Siemens CPU.

<ul> <li>Enable bus functionality via VSC</li> <li>To switch the interface X3 MPI(PtP) to PROFIBUS functionality you to activate the according bus functionality by means of a Yaskawa V storage media. By plugging the VSC storage card and then an overareset the according functionality is activated. Schap. 4.16 'Deployn storage media - VSD, VSC' page 119</li> </ul>	SC all
--	-----------

Steps of configuration

For the configuration of the PROFIBUS DP master please follow the following approach:

- Enable bus functionality via VSC
- Hardware configuration CPU
- Deployment as DP master or DP slave
  - With activating the bus function *'PROFIBUS DP master'* by means of the VSC, the bus function *'PROFIBUS DP slave'* is also unlocked.
- Transfer of the complete project to CPU

With the Siemens SIMATIC Manager, the System SLIO CPU 013-CCF0R00 is to be configured as

CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3)

The integrated PROFIBUS DP master (X3) is to be configured and connected via the sub module X1 (MPI/DP).

PROFIBUS communication

# **11.2 PROFIBUS** communication

	<ul> <li>Enable bus functionality via VSC</li> <li>To switch the interface X3 MPI(PtP) to PROFIBUS functionality you have to activate the according bus functionality by means of a Yaskawa VSC storage media. By plugging the VSC storage card and then an overall reset the according functionality is activated. Schap. 4.16 'Deployment storage media - VSD, VSC' page 119</li> </ul>
PROFIBUS DP	<ul> <li>PROFIBUS is an international standard applicable to an open and serial field bus for building, manufacturing and process automation that can be used to create a low (sensor-/actuator level) or medium (process level) performance network of programmable logic controllers.</li> <li>PROFIBUS comprises an assortment of compatible versions. The following details refer to PROFIBUS DP.</li> <li>PROFIBUS DP is a special protocol intended mainly for automation tasks in a manufacturing environment. DP is very fast, offers Plug'n'Play facilities and provides a costeffective alternative to parallel cabling between PLC and remote I/O. PROFIBUS DP was designed for high-speed data communication on the sensor-actuator level.</li> <li>The data transfer referred to as "Data Exchange" is cyclical. During one bus cycle, the master reads input values from the slaves and writes output information to the slaves.</li> </ul>
CPU with DP master	The PROFIBUS DP master is to be configured in the hardware configurator from Sie- mens. Here the configuration happens by the sub module X1 (MPI/DP) of the Siemens CPU. After the transmission of the data to the CPU, the configuration data are internally passed on to the PROFIBUS master part. During the start-up the DP master automati- cally includes his data areas into the address range of the CPU. Project engineering in the CPU is not required.
Deployment of the DP master with CPU	Via the PROFIBUS DP master PROFIBUS DP slaves may be coupled to the CPU. The DP master communicates with the DP slaves and links up its data areas with the address area of the CPU. At every POWER ON respectively overall reset the CPU fetches the I/O mapping data from the master. At DP slave failure, the OB 86 is requested. If this is not available, the CPU switches to STOP and BASP is set. As soon as the BASP signal comes from the CPU, the DP master is setting the outputs of the connected periphery to zero. The DP master remains in the operating mode RUN independent from the CPU.
DP slave operation	For the deployment in a super-ordinated master system you first have to project your slave system as Siemens CPU in slave operation mode with configured in-/output areas. Afterwards you configure your master system. Couple your slave system to your master system by dragging the CPU 31x from the hardware catalog at <i>Configured stations</i> onto the master system, choose your slave system and connect it.
Operating mode DP slave: Test, commissioning, routing (active/passive)	<ul> <li>There is the possibility to enable the option <i>'Test, commissioning, routing'</i> in the hardware configuration by means of the properties dialog of the PROFIBUS via the register <i>'Operating mode'</i> at <i>'DP slave'</i>. The activation affects as follows:</li> <li>The PROFIBUS interface gets an "active" PROFIBUS node, this means it is involved in the token rotation.</li> <li>Via this interface you have PG/OP functions (programming, status request, control, test).</li> <li>The PROFIBUS interface serves as a gateway (S7 routing).</li> <li>The bus rotation time can exceed.</li> </ul>

Hardware configuration - CPU

When disabled, the PROFIBUS interface operates as passive DP slave with the following characteristics:

- The PROFIBUS interface gets an "passive" PROFIBUS node, this means it is not involved in the token rotation.
- Bus rotation time is not influenced.
- S7 routing is not possible.

# 11.3 Enable bus functionality via VSC

Enabling & 'Overview' page 119

### 11.4 Hardware configuration - CPU

#### Precondition

The configuration of the CPU takes place at the Siemens *'hardware configurator'*. The hardware configurator is part of the Siemens SIMATIC Manager. It serves for project engineering. Please use for configuration the Siemens SIMATIC Manager V 5.5 SP2 and up. The modules, which may be configured here are listed in the hardware catalog. If necessary you have to update the hardware catalog with *'Options*  $\rightarrow$  Update Catalog'.

For project engineering a thorough knowledge of the Siemens SIMATIC Manager and the Siemens hardware configurator is required!

#### Proceeding

With the Siemens SIMATIC Manager the following steps should be executed:

- **1.** Start the Siemens hardware configurator with a new project.
- **2.** Insert a profile rail from the hardware catalog.
- 3. Place at 'Slot'-Number 2 the CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).

Slot	Module
1	
2	CPU 31
X1	MPI/DP
X2	PN-IO
X2	Port 1
X2	Port 2
3	

The integrated PROFIBUS DP master (X3) is to be configured and connected via the sub module X1 (MPI/DP).

# 11.5 Deployment as PROFIBUS DP master

Precondition

The hardware configuration described before was established.

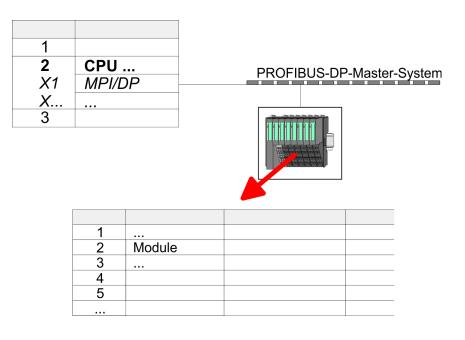

### Proceeding

- **1.** Open the properties dialog of the DP interface of the CPU by means of a doubleclick at *'MPI/DP'*.
- 2. Set at Interface: Type "PROFIBUS".
- **3.** Connect to PROFIBUS and preset an address (preferably 2). Confirm your input with [OK].
- 4. Switch at Operating mode to "DP master" and confirm the dialog with [OK].
  - ⇒ A PROFIBUS DP master system is inserted:

Now the project engineering of your PROFIBUS DP master is finished. Please link up now your DP slaves with periphery to your DP master.

- **1.** For the project engineering of PROFIBUS DP slaves you search the concerning PROFIBUS DP slave in the hardware catalog and drag&drop it in the subnet of your master.
- 2. Assign a valid PROFIBUS address to the DP slave.
- **3.** Link up the modules of your DP slave system in the plugged sequence and add the addresses that should be used by the modules.
- **4.** If needed, parametrize the modules.
- **5.** Save, compile and transfer your project.

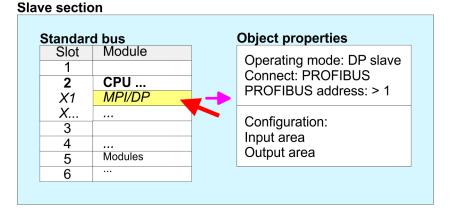

Deployment as PROFIBUS DP slave

# 11.6 Deployment as PROFIBUS DP slave

The Deployment as			
Fast introduction	In the following the deployment of the PROFIBUS section as "intelligent" DP slave on master system is described, which exclusively may be configured in the Siemens SIMATIC Manager. The following steps are required:		
	<b>1.</b> Configure a station with a CPU with operating mode DP slave.		
	<b>2.</b> Connect to PROFIBUS and configure the in-/output area for the slave section.		
	3. Save and compile your project.		
	<b>4.</b> Configure another station with another CPU with operating mode DP master.		
	5. Connect to PROFIBUS and configure the in-/output ranges for the master section.		
	<b>6.</b> Save, compile and transfer your project to your CPU.		
Project engineering of the slave section	Start the Siemens SIMATIC Manager and configure a CPU as described at "Hard- ware configuration - CPU".		
	<b>2.</b> Designate the station as "DP slave".		
	3. Add your modules according to the real hardware assembly.		
	Open the properties dialog of the DP interface of the CPU by means of a double- click at 'MPI/DP'.		

- 5. Set Interface type to "PROFIBUS".
- 6. Connect to PROFIBUS and preset an address (e.g. 3) and confirm with [OK].
- 7. Switch at Operating mode to "DP slave" .
- 8. Via Configuration you define the in-/output address area of the slave CPU, which are to be assigned to the DP slave.
- 9. Save, compile and transfer your project to your CPU.

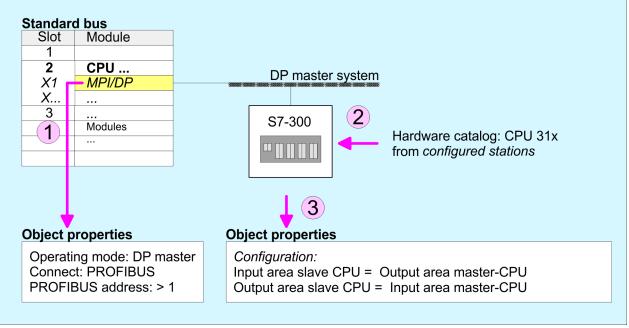

# Project engineering of the master section

- **1.** Insert another station and configure a CPU.
- **2.** Designate the station as "...DP master".
- 3. Add your modules according to the real hardware assembly.
- **4.** Open the properties dialog of the DP interface of the CPU by means of a doubleclick at *'MPI/DP'*.
- **5.** Set Interface: type to "PROFIBUS".
- 6. Connect to PROFIBUS and preset an address (e.g. 2) and confirm with [OK].
- 7. Switch at Operating mode to "DP master" and confirm the dialog with [OK].

- 8. Connect your slave system to this master system by dragging the "CPU 31x" from the hardware catalog at *Configured stations* onto the master system and select your slave system to be coupled.
- 9. Open the Configuration at Object properties of your slave system.
- **10.** Via double click to the according configuration line you assign the according input address area on the master CPU to the slave output data and the output address area to the slave input data.
- **11.** Save, compile and transfer your project to your CPU.

#### **Master section**

Deployment as PROFIBUS DP slave > Diagnostic functions

#### 11.6.1 Diagnostic functions

## Overview

PROFIBUS DP provides an extensive set of diagnostic functions for quick error localization. Diagnostic messages are transferred via the bus and collected by the master. In the operating mode DP slave the CPU sends diagnostic data when requested by the master or in case of an error. Since a part of the diagnostic data (Byte 11 ... 15) is located in the peripheral address area of the CPU, you may start the diagnostics and modify the diagnostic data. Diagnostic data consist of:

- Standard diagnostic data (Byte 0 ... 5),
- Device specific diagnostic data (Byte 6 ... 15).

#### Structure

The diagnostic data have the following structure:

#### Standard diagnostic data

Byte 0	Station status 1
Byte 1	Station status 2
Byte 2	Station status 3
Byte 3	Master address
Byte 4	Ident number (low)
Byte 5	Ident number High

#### Device specific diagnostic data

Byte 6	Length and code device specific diagnostic
Byte 7	Device specific diagnostic messages
Byte 8	reserved
Byte 10	
Byte 11 Byte 15	User-specific diagnostic data is mapped into the peripheral addressing range of the CPU and may be modified and sent to the master.

Deployment as PROFIBUS DP slave > Diagnostic functions

# Standard diagnostic data

More detailed information to the structure of the slave standard diagnostic data can be found in the standard papers of the PROFIBUS User Organization. The slave diagnostic data have the following structure:

Byte	Bit 7 Bit 0
0	<ul> <li>Bit 0: 0 (fix)</li> <li>Bit 1: Slave is not yet ready for data exchange</li> <li>Bit 2: Configuration data are not identical</li> <li>Bit 3: Slave has external diagnostic data</li> <li>Bit 4: Slave does not provide this function</li> <li>Bit 5: 0 (fix)</li> <li>Bit 6: Wrong parametrization</li> <li>Bit 7: 0 (fix)</li> </ul>
1	<ul> <li>Bit 0: Slave needs new parametrization</li> <li>Bit 1: Static diagnostic</li> <li>Bit 2: 1 (fix)</li> <li>Bit 3: Response monitoring active</li> <li>Bit 4: Freeze command received</li> <li>Bit 5: Sync command received</li> <li>Bit 6: reserved</li> <li>Bit 7: 0 (fix)</li> </ul>
2	<ul><li>Bit 0 Bit 6: reserved</li><li>Bit 7: Diagnostic data overflow</li></ul>
3	Master address after parametrization
4	ID number high byte
5	ID number low byte

Deployment as PROFIBUS DP slave > Diagnostic functions

# Device specific diagnostic data

The device related diagnostic data provide detailed information on the slave and the peripheral modules. The length of the device related diagnostic data is fixed at 10byte

Byte	Bit 7 Bit 0
6	<ul> <li>Bit 0 5: Length device specific diagnostic data</li> <li>001010: Length 10byte (fix)</li> <li>Bit 6 7: Code for device specific diagnostic</li> <li>00: Code 00 (fix)</li> </ul>
7	<ul> <li>Device specific diagnostic message         <ul> <li>12h: Error: Data length parameters</li> <li>13h: Error: Data length configuration data</li> <li>14h: Error: Configuration entry</li> <li>15h: Error: VPC3 buffer calculation</li> <li>16h: Missing configuration data</li> <li>17h: Error: Comparison DP parametrization and configuration</li> <li>40h: User specific diagnostic data is valid</li> </ul> </li> </ul>
810	reserved
1115	User specific diagnostic data that are stored behind the diagnostic status byte in the process picture of the CPU. This data may be overwritten and forwarded to the master.

## **Release diagnostic**

- In case of a diagnostic the contents of Byte 11 ... 15 of the device specific diagnostic data will be transferred to the process image of the CPU and this preceded by a status byte.
- Where this diagnostic block with a length of 6byte is located in the process image can be defined via the CPU parameters.
- You start diagnostics by means of a status change from 0 → 1 in the diagnostic status byte. This transmits the respective diagnostic message to the master.

A status of 0000 0011 is ignored!

The diagnostic block of the CPU has the following structure:

Byte	Bit 7 Bit 0
0	<ul> <li>Diagnostic status byte</li> <li>Bit 0: User specific diagnostic data <ul> <li>0: Invalid diagnostic data</li> <li>1: Valid diagnostic data</li> <li>(starting a diagnostic)</li> </ul> </li> <li>Bit 1: Delete diagnostic <ul> <li>0: Diagnostic deletion not valid</li> <li>1: Diagnostic deletion valid</li> </ul> </li> <li>Bit 2 Bit 7: reserved</li> </ul>
1 5	User specific diagnostic data equal to Byte 11 15 of device specific diagnostic

# 11.7 **PROFIBUS** installation guidelines

#### **PROFIBUS** in general

A PROFIBUS DP network may only be built up in linear structure.

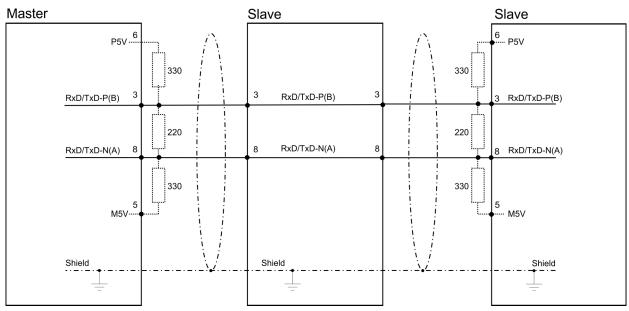

- PROFIBUS DP consists of minimum one segment with at least one master and one slave.
- A master has always been deployed together with a CPU.
- PROFIBUS supports max. 126 participants.
- Per segment a max. of 32 participants is permitted.
- The max. segment length depends on the transfer rate: 9.6 ... 187.5bit/s → 1000m 500kbit/s → 400m 1.5Mbit/s → 200m
  - $3 \dots 12$ Mbit/s  $\rightarrow 100$ m
- Max. 10 segments may be built up. The segments are connected via repeaters. Every repeater counts for one participant.
- The bus respectively a segment is to be terminated at both ends.
- All participants are communicating with the same transfer rate. The slaves adjust themselves automatically on the transfer rate.

**Transfer medium** 

- As transfer medium PROFIBUS uses an isolated twisted-pair cable based upon the RS485 interface.
- The RS485 interface is working with voltage differences. Though it is less irritable from influences than a voltage or a current interface. You are able to configure the network as well linear as in a tree structure.
- Max. 32 participants per segment are permitted. Within a segment the members are linear connected. The segments are connected via repeaters. The maximum segment length depends on the transfer rate.
- PROFIBUS DP uses a transfer rate between 9.6kbit/s and 12Mbit/s, the slaves are following automatically. All participants are communicating with the same transfer rate.
- The bus structure under RS485 allows an easy connection res. disconnection of stations as well as starting the system step by step. Later expansions don't have any influence on stations that are already integrated. The system realizes automatically if one partner had a fail down or is new in the network.

#### **Bus connection**

The following picture illustrates the terminating resistors of the respective start and end station.

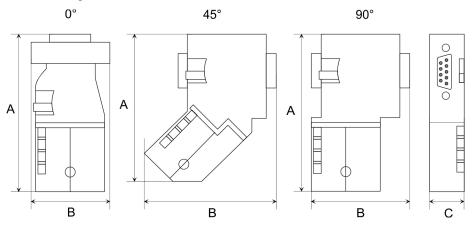

PROFIBUS installation guidelines

The PROFIBUS line has to be terminated with its ripple resistor. Please make sure to terminate the last participants on the bus at both ends by activating the terminating resistor.

#### EasyConn bus connector

In PROFIBUS all participants are wired parallel. For that purpose, the bus cable must be feed-through. Via the order number 972-0DP10 you may order the bus connector "Easy-Conn" from Yaskawa. This is a bus connector with switchable terminating resistor and integrated bus diagnostic.

Dimensions in mm	0°	45°	90°
A	64	61	66
В	34	53	40
C	15.8	15.8	15.8

To connect this EasyConn plug, please use the standard PROFIBUS cable type A (EN50170). Starting with release 5 you also can use highly flexible bus cable:

Lapp cable order no: 2170222, 2170822, 2170322.

With the order no. 905-6AA00 Yaskawa offers the "EasyStrip" de-isolating tool that makes the connection of the EasyConn much easier.

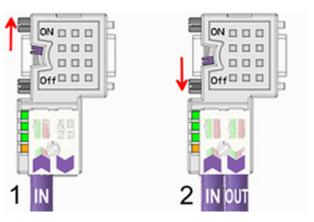

Dimensions in mm

*Termination with "Easy-Conn"* 

The "EasyConn" bus connector is provided with a switch that is used to activate a terminating resistor.

Commissioning and Start-up behavior

#### Wiring

- [1] 1./last bus participant
- [2] further participants

## CAUTION!

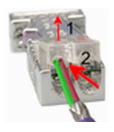

The terminating resistor is only effective, if the connector is installed at a bus participant and the bus participant is connected to a power supply.

The tightening torque of the screws to fix the connector to a device must not exceed 0.02Nm!

A complete description of installation and deployment of the terminating resistors is delivered with the connector.

#### Assembly

- **1.** Loosen the screw.
- 2. Lift contact-cover.
- 3. Insert both wires into the ducts provided (watch for the correct line colour as below!)
- 4. Please take care not to cause a short circuit between screen and data lines!

The green line must be connected to A, the red line to B!

- **5.** Close the contact cover.
- **6.** Tighten screw (max. tightening torque 0.08Nm).

11.8 Commissioning and Start-up behavior

#### Start-up on delivery

In delivery the CPU is overall reset. The PROFIBUS part is deactivated and its LEDs are off after Power ON.

Commissioning and Start-up behavior

Online with bus parameter without slave project	he DP master can be served with bus parameters by means of a hardware configura- on. As soon as these are transferred the DP master goes online with his bus parameter. his is shown by the RUN LED. Now the DP master can be contacted via PROFIBUS by heans of his PROFIBUS address. In this state the CPU can be accessed via PROFIBUS of get configuration and DP slave project.				
Slave configuration	If the master has received valid configuration data, he switches to <i>Data Exchange</i> with the DP Slaves. This is indicated by the DE-LED.				
CPU state controls DP master	After PowerON respectively a receipt of a new hardware configuration the configuration data and bus parameter were transferred to the DP master. Dependent on the CPU state the following behavior is shown by the DP master:				
Master behavior at CPU STOP	<ul> <li>The global control command "Clear" is sent by the master. Then the DP slaves disable the outputs.</li> <li>DP slaves with fail safe mode were provided with output telegram length "0".</li> <li>DP slaves without fail safe mode were provided with the whole output telegram but with output data = 0.</li> <li>The input data of the DP slaves were further cyclically transferred to the input area of the CPU.</li> </ul>				
Master behavior at CPU RUN	<ul> <li>The global control command "Operate" is sent by the master. Then the DP slaves enable the outputs.</li> <li>Every connected DP slave is cyclically attended with an output telegram containing recent output data.</li> <li>The input data of the DP slaves were cyclically transferred to the input area of the CPU.</li> </ul>				

# 12 Configuration with SPEED7 Studio

# 12.1 SPEED7 Studio - Overview

SPEED7 Studio - Working environment

In this part the project engineering of the CPU in the *SPEED7 Studio* is shown. Here only the basic usage of the *SPEED7 Studio* together with a CPU is shown. Please note that software changes can not always be considered and it may thus be deviations to the description. In the *SPEED7 Studio* your PLCs may be configured and linked. For diagnostics online tools are available.

More information can be found in the online help respectively in documentation of the SPEED7 Studio.

# Starting the SPEED7 Studio

- Click at the button. You can find SPEED7 Studio in Windows Start at 'VIPA'.
  - ⇒ SPEED7 Studio is started. The start page is opened.

### SPEED7 Studio

OStart:	<b>B</b>	ecently used Pro	jects:	
New project	> 🗊	Project Folder MyProject	Source	Last Access v 10/29/2013 5:59:03 PM
Open project		my roject		20/25/2022 555505 11
Import project				
Delete project				
Project:				
Project overview				
Add new device				

- (1) Start (2) Project
- You can create a new project, open a saved project, or delete projects. If a project is open, you can open the *'Project overview'* or add a new device.
- (3) Last projects Here recently opened projects are listed.

You can repeatedly run SPEED7 Studio in order to work with different projects. You can not open the same project in the various instances of SPEED7 Studio.

SPEED7 Studio - Work environment

#### End SPEED7 Studio

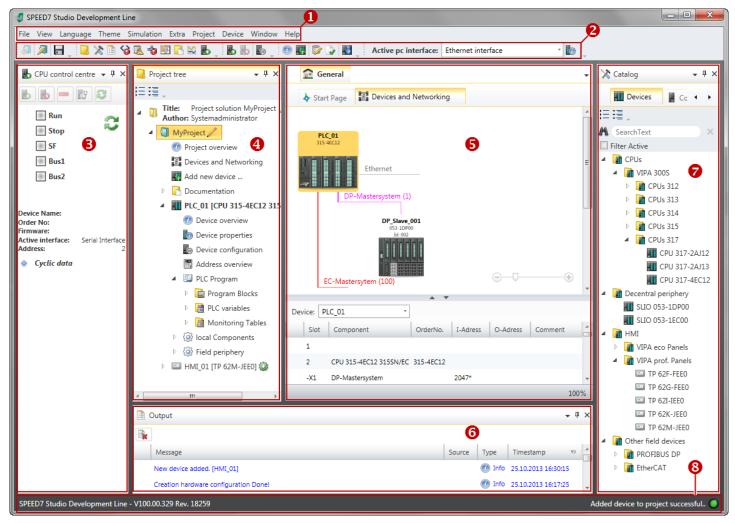

Select one of the following options if you want to end the program:

- Main window: Click on the Close button of the SPEED7 Studio program window.
- Menu bar Select 'File → Exit'.
- Keyboard: Press [Alt] + [F4].

After you have made changes to the project, a dialogue window opens where you can select whether to save or ignore the changes.

⇒ SPEED7 Studio is ended.

# 12.2 SPEED7 Studio - Work environment

- (1) Menu bar
- (2) Toolbar
- (3) CPU control centre
- (4) Project tree

- (5) Area of operations
- (6) Output range
- (7) Catalog/properties
- (8) Status line

You can show and hide additional windows and the arrangement and size of the windows can be adjusted.

(1) Menu bar	Most of the commands you need for working with <i>SPEED7 Studio</i> are provided in the menu bar. Further commands can be accessed via the context menus using the right mouse button, e.g. functions of a device in the project tree.
	The menu commands <i>'Project'</i> and <i>'Device'</i> are only shown if a project is open. The menu commands <i>'Image'</i> is only shown if a HMI image is open.
	You can use the menus with the mouse or the keyboard.
(2) Toolbar	Important commands you need for working with <i>SPEED7 Studio</i> are provided in the toolbar. More commands can be accessed via the toolbars and push buttons of different editors.
	Some of the commands in the toolbar are only shown if a project is open.
(3) CPU control centre	In the CPU control centre, you can view the current mode and other control data and con- trol the CPU.
(4) Project tree	Any project device and project data can be accessed via the project tree. The project tree includes any object which you have created in the project, e.g. devices, components, pro- gram blocks, HMI images. Here you can add or remove devices and components. Fur- thermore, you can open editors in order to edit settings, configurations, the control pro- gram and visualisation.
(5) Area of operations	Devices and project data can be edited in the area of operations. You can open different editors for this purpose. The register in the area of operations is divided into two register levels. You can switch through the editors in the area of operations via the tabs.
(6) Output range	Information on executed activities and background operations are displayed on the output range.
(7) Catalog/properties	Devices and components which you want to add to the project can be selected in the cat- alog. You can also select objects which you want to add to the PLC program or to HMI images.
(8) Status line	The version of <i>SPEED7 Studio</i> is displayed at the left edge of the status line. The pro- gress bar for background operations and status messages is shown at the right edge. As long as there are no background operations, the status message created at last is shown.

#### 12.2.1 Project tree

- (1) Title and author
- (2) Project
- (3) Documentation
- (4) PLC
- (5) Motion Control
- (6) PLC program
- (7) Local components
- (8) Field periphery
- (9) HMI

In the project tree, you can access commands in order to add or delete objects, e.g. add/ delete devices or add/delete blocks.

You can open editors via the project tree if you want to edit settings, configurations, the control program and visualisation.

Moreover, you can retrieve information, e.g. project overview, device properties or properties of the bus system.

If the project tree is not displayed, you must select either 'View -> Project tree' or press Show project tree [Strg]+[Shift]+[P]. Show projects in the In order to display the project in the project tree, you must create a new project or open a stored project. project tree It is not possible to edit several projects at the same time. It is possible to run SPEED7 Studio simultaneously several times on one PC if you want to use it for various projects. Show/hide objects The objects in the project tree are arranged in a tree structure. You can show or hide objects: Hide all objects ('Project → Reduce project tree') := Show all objects ('Project → Expand project tree') Þ Hide slave objects / close folder Show slave objects / open folder

#### Recognise object state

Icons behind an object in the project tree provide indications of the object state.

Devices and components which you want to add to the project can be selected in the catalog. You can also select objects which you want to add to the PLC program or to HMI images.

#### Show catalog:

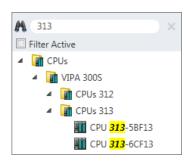

If the catalog is not displayed, you must select either 'View  $\rightarrow$  Catalog' or press [Strg]+ [Shift]+[C].

- (1) Switch to another view If the properties are displayed instead of the catalog, you must click on 'Catalog' at the lower screen edge.
- (2) Register Certain tabs are displayed in the catalog, depending on which editor window is opened in the foreground.
- (3) Show/hide objects The objects in the catalog are arranged in a tree structure. You can show or hide objects: Hide all objects (' $Project \rightarrow Reduce \ project \ tree$ ')
  - Hide all objects ('Project → Reduce catalog tree')
  - $\exists$  Show all objects ('Project  $\rightarrow$  Expand catalog tree')
  - Hide slave objects / close folder
  - Show slave objects / open folder

#### Configuration with SPEED7 Studio

SPEED7 Studio - Work environment > Catalog

## (4) Search

You can search for certain objects in the catalog.

- **1.** Enter a search text in the input field.
  - ⇒ Only those objects are displayed in the catalog which contain the search text.
- **2.**  $\blacktriangleright$  Click on  $\boxtimes$  to delete the search text.

 $\Rightarrow$  The object is added.

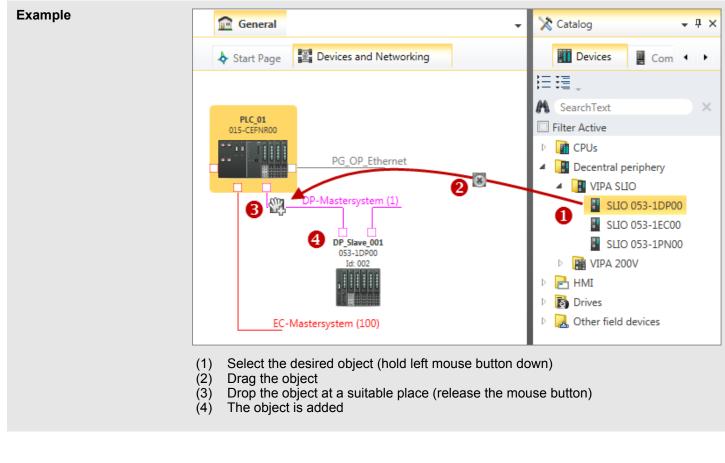

⇒ All objects are displayed in the catalog.

(5) Filter

With 'enabled' Filter, only these modules are shown in the Catalog which are relevant for configuration

### (6) Add object

Drag the desired object from the catalog to a suitable position.

#### (7) Catalog information

The catalog information shows detailed information of the selected object, e.g. name, producer, version and order information.

SPEED7 Studio - Hardware configuration - CPU

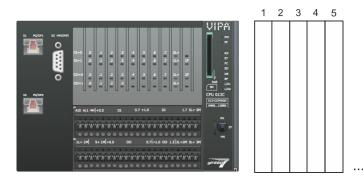

# 12.3 SPEED7 Studio - Hardware configuration - CPU

#### Precondition

For project engineering a thorough knowledge of the SPEED7 Studio is required!

### Proceeding

- 1. Start the SPEED7 Studio.
- **2.** Create a new project in the Work area with 'New project'.
  - ⇒ A new project is created and the view *'Devices and networking'* is shown.
- 3. Click in the Project tree at 'Add new device ...'.
  - $\Rightarrow$  A dialog for device selection opens.
- 4. Select from the 'Device templates' your CPU and click at [OK].
  - ⇒ The CPU is inserted in 'Devices and networking' and the 'Device configuration' is opened.

## **Device configuration**

Slot	Module	 	 
0	CPU 013-CCF0R00		
-X1	PG_OP_Ethernet		
-X3	MPI interface		

SPEED7 Studio - Hardware configuration - Ethernet PG/OP channel

#### SPEED7 Studio - Hardware configuration - Ethernet PG/OP channel 12.4

## Overview

	<ul> <li>Please note!         <ul> <li>At the first commissioning respectively after a reset to factory setting the Ethernet interface has no IP address.</li> <li>For online access, you have to assign valid IP address data to it by means of "Initialization".</li> <li>After initialization, you can transfer the IP address data to your project.</li> </ul> </li> </ul>
	The CPU has an integrated Ethernet PG/OP channel. This channel allows you to pro- gram and remote control your CPU.
	<ul> <li>The Ethernet PG/OP channel (X1/X2) is designed as switch. This enables PG/OP communication via the connections X1 and X2.</li> <li>Configurable connections are possible.</li> <li>DHCP respectively the assignment of the network configuration with a DHCP server is supported.</li> <li>Default diagnostics addresses: 2025 2040</li> <li>Via the Ethernet PG/OP channel, you have access to: <ul> <li>Device website, where you can find information on firmware status, connected peripherals, current cycle times, etc.</li> <li>OPC UA project, which is to be created in the OPC UA Configurator.</li> <li>WebVisu project, which is to be created in the SPEED7 Studio.</li> <li>PROFINET IO controller or the PROFINET I-Device.</li> </ul> </li> </ul>
Assembly and commis- sioning	<ol> <li>Install your System SLIO with your CPU.</li> <li>Wire the system by connecting cables for voltage supply and signals.</li> <li>Connect the one of the Ethernet jacks (X1, X2) of the Ethernet PG/OP channel to Ethernet.</li> </ol>

- **4.** Switch on the power supply.
  - ⇒ After a short boot time the CP is ready for communication. He possibly has no IP address data and requires an initialization.

SPEED7 Studio - Hardware configuration - Ethernet PG/OP channel

"Initialization"

The assignment of IP address data takes place via the MAC address. The IP address of your Ethernet PG/OP channel for the interfaces X1 and X2 can be found on the front of your CPU with the name "MAC PG/OP: ...".

X1 PG/OP

X2 PG/OP

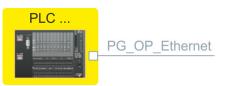

**↓** 

MAC PG/OP: 00-20-D5-77-05-10

The assignment of the IP address data happens online in the *SPEED7 Studio* with the following proceeding:

- **1.** Start the SPEED7 Studio with your project.
- **2.** Click in the *Project tree* at 'Devices and networking'.
  - $\Rightarrow$  You will get a graphical object view of your CPU.

- 3. Click at the network 'PG\_OP\_Ethernet'.
- **4.** ▶ Select 'Context menu → Determine accessible partner'.
  - $\Rightarrow$  A dialog window opens.

4	
Active gateway	Ethernet interface
Network interface card: Net	Search

- 5. Select the according network interface card, which is connected to the Ethernet PG/OP channel and click at *'Search'* to determine the via MAC address reachable device.
  - $\Rightarrow$  The network search is started and the found stations are listed in a table.

Project tree
Project...
...
Devices and networking

SPEED7 Studio - Hardware configuration - Ethernet PG/OP channel

6.		Devices	IP	MAC	Device	 
	1		172.20	00:20:	Yaskawa	
	2					

Click in the list at the module with the known MAC address. This can be found at the front of the CPU labelled as "MAC PG/OP: ...".

- 7. Click at 'Set IP address'. Now set the IP configuration by entering 'IP address', 'Subnet mask' and 'Gateway'. You get valid IP address parameters from your system administrator.
- 8. Click at 'Set IP address'.
  - ⇒ The IP address is transferred to the module and the list is refreshed. Directly after the assignment the Ethernet PG/OP channel is online reachable using the set IP address data. The value remains as long as it is reassigned, it is overwritten by a hardware configuration or a factory reset is executed.
- **9.** With clicking at '*Apply settings*' the IP address data a stored in the project.

Take IP address parameters in project

- If you are not online, you can assign IP address data to your Ethernet PG/OP channel with following proceeding:
- **1.** Start the SPEED7 Studio with your project.
- **2.** Click in the *Project tree* at 'Devices and networking'.
  - $\Rightarrow$  You will get a graphical object view of your CPU.

- 3. Click at the network 'PG\_OP\_Ethernet'.
- 4. ▶ Select 'Context menu → Interface properties'.
  - A dialog window opens. Here you can enter the IP address data for your Ethernet PG/OP channel.
- **5.** Confirm with [OK].
  - ⇒ The IP address data are stored in your project listed in 'Devices and networking' at 'Local components'.

After transferring your project your CPU can be accessed via Ethernet PG/OP channel with the set IP address data.

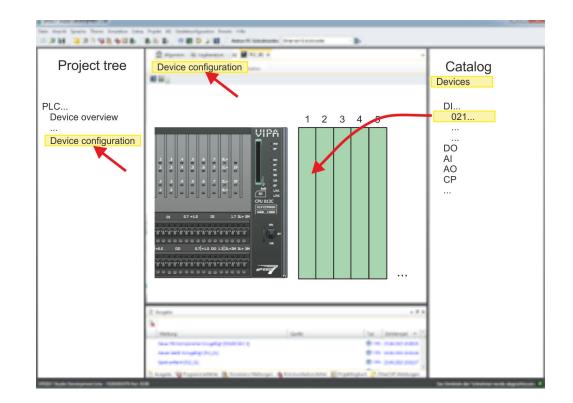

#### Local components

Slot	Module	 	IP address	
0	CPU 013-CCF0R00			
-X1	PG_OP_Ethernet		172.20.120.40	
-X3	MPI interface			

# 12.5 SPEED7 Studio - Hardware configuration - I/O modules

# Hardware configuration of the modules

- **1.** Click in the 'Project tree' at 'PLC... > Device configuration'.
- 2. Starting with slot 1 place in the *'Device configuration'* your System SLIO modules in the plugged sequence. For this drag from the hardware catalog the corresponding module to the corresponding position in the *Device configuration*.

## Parametrization

For parametrization double-click in the *'Device configuration'* on the module you want to parametrize. Then the parameters of the module are shown in a dialog. Here you can make your parameter settings.

**Parametrization during runtime** By using the SFCs 55, 56 and 57 you may alter and transfer parameters for wanted modules during runtime. For this you have to store the module specific parameters in so called "record sets". More detailed information about the structure of the record sets is to find in the according module description.

# 12.6 Deployment I/O periphery

# 12.6.1 Overview

Project engineering and parametrization

- On this CPU the connectors for digital respectively analog signal and *Technological functions* are combined in a one casing.
- Die Project engineering happens in the SPEED7 Studio as CPU 013-CCF0R00.
- For parametrization of the digital I/O periphery and the technological functions the corresponding sub modules of the CPU013-CCF0R00 are to be used.
- The controlling of the operating modes of the *technological functions* happens by means of handling blocks of the user program.

Deployment I/O periphery > Digital input

#### 12.6.2 Analog input

12.6.2.1 Overview

- 2xUx12Bit (0 ... 10V)
- Sub module 'AI2'
- 🗳 Chap. 5.3 'Analog input' page 128

#### 12.6.2.2 Parametrization in SPEED7 Studio

12.6.2.2.1 'I/O addresses'

Sub module	Input address	Access	Assignment
AI2	800	WORD	Analog input channel 0 (X4)
	802	WORD	Analog input channel 1 (X4)

#### 12.6.2.2.2 'Parameter'

'Filtering channel 0/1'

The analog input part has a filter integrated. The parametrization of the filter happens via the parameter *'Filter channel 0/1'*. The default value of the filter is 1000ms. The following values can be entered:

- 2ms: no filter
- 100ms: small filter
- 1000ms: medium filter
- 10000ms: maximum filter

## 12.6.3 Digital input

#### 12.6.3.1 Overview

- 16xDC 24V
- Sub module 'DI16/DO12'
- Chap. 5.4 'Digital input' page 131

### 12.6.3.2 Parametrization in SPEED7 Studio

12.6.3.2.1 'I/O addresses'

Sub module	Input address	Access	Assignment
DI16/DO12	136	BYTE	Digital input I+0.0 I+0.7 (X4)
	137	BYTE	Digital input I+1.0 I+1.7 (X4)

#### 12.6.3.2.2 'Inputs'

# 'Trigger for process interrupt'

Here you can specify a hardware interrupt for each input for the corresponding edge. The hardware interrupt is disabled, if nothing is selected (default setting). A diagnostics interrupt is only supported with *Hardware interrupt lost*.

Deployment I/O periphery > Counter

Here is valid:

- Rising edge: Edge 0-1
- Falling edge: Edge 1-0

#### Input delay

- The input delay can be configured per channel in groups of 4.
- An input delay of 0.1ms is only possible with "fast" inputs, which have a max. input frequency of 100kHz § 'X4: Connector' page 53. Within a group, the input delay for slow inputs is limited to 0.5ms.
- Range of values: 0.1ms / 0.5ms / 3ms / 15ms
- 12.6.4 Digital output
- 12.6.4.1 Overview
- 12xDC 24V, 0.5A
- Sub module 'DI16/DO12'
- Chap. 5.5 'Digital output' page 134

### 12.6.4.2 Parametrization in SPEED7 Studio

12.6.4.2.1 'I/O addresses'

Sub module	Output address	Access	Assignment
DI16/DO12	136	BYTE	Digital output Q+0.0 Q+0.7 (X5)
	137	BYTE	Digital output Q+1.0 Q+1.3 (X5)

- 12.6.5 Counter
- 12.6.5.1 Overview
- 4 channels
- Sub module: 'Counter'

# 12.6.5.2 Parametrization in SPEED7 Studio

12.6.5.2.1 'I/O addresses'

Sub module	Input address	Access	Assignment
Count	816	DINT	Channel 0: Counter value / Frequency value
	820	DINT	Channel 1: Counter value / Frequency value
	824	DINT	Channel 2: Counter value / Frequency value
	828	DINT	Channel 3: Counter value / Frequency value

Deployment I/O periphery > Counter

## 12.6.5.2.2 Basic parameters

#### Select interrupt

Via 'Basic parameters' you can reach 'Select interrupt'. Here you can define the interrupts the CPU will trigger. The following parameters are supported:

- None: The interrupt function is disabled.
- Process: The following events of the counter can trigger a hardware interrupt (selectable via 'Count'):
  - Hardware gate opening
  - Hardware gate closing
  - On reaching the comparator
  - on Counting pulse
  - on overflow
  - on underflow
- Diagnostics+process: A diagnostics interrupt is only triggered when a hardware interrupt was lost.

#### 12.6.5.2.3 *'Channel x'*

**Operating mode** 

Select via 'Channel' the channel select via 'Operating' the counter operating mode. The following counter operating modes are supported:

- Not parametrized: Channel is de-activated
- Count endless
- Count once
- Count periodical

#### Counter

**Operating mode** Default values and structure of this dialog box depend on the selected 'Operating mode'.

#### **Parameter overview**

Operating parameters	Description	Assignment
Main count direction	<ul> <li>None No restriction of the counting range</li> <li>Up: Restricts the up-counting range. The counter starts from 0 or <i>load value</i>, counts in positive direction up to the declaration <i>end value</i> -1 and then jumps back to <i>load value</i> at the next positive transducer pulse.</li> <li>Down: Restricts the down-counting range. The counter starts from the declared <i>start value</i> or <i>load value</i> in negative direction, counts to 1 and then jumps to <i>start value</i> at the next negative encoder pulse. Function is disable with <i>count continuously</i>.</li> </ul>	None
Gate function	<ul> <li><i>Cancel count:</i> The count starts when the gate opens and resumes at the <i>load value</i> when the gate opens again.</li> <li><i>Stop count:</i> The count is interrupted when the gate closes and resumed at the last actual counter value when the gate opens again.</li> <li><i>Chap. 5.6.6.2 'Gate function' page 150</i></li> </ul>	Abort count process

Deployment I/O periphery > Counter

Operating parameters	Description	Assignment
Start value	Start value with counting direction backward.	2147483647 (2 <sup>31</sup> -1)
End value	End value with main counting direction forward.	
	Range of values: 22147483647 (2 <sup>31</sup> -1)	
Comparison value	<ul> <li>The count value is compared with the <i>comparison value</i>. See also the parameter "Characteristics of the output":</li> <li>No main counting direction <ul> <li>Range of values: -2)<sup>31</sup> to +2)<sup>31</sup>-1</li> </ul> </li> <li>Main counting direction forward <ul> <li>Range of values: -2<sup>31</sup> to end value-1</li> </ul> </li> <li>Main counting direction backward <ul> <li>Range of values: 1 to +2<sup>31</sup>-1</li> </ul> </li> </ul>	0
Hysteresis	The <i>hysteresis</i> serves the avoidance of many toggle pro- cesses of the output, if the counter value is in the range of the <i>comparison value</i> . 0, 1: <i>Hysteresis</i> disabled Range of values: 0 to 255	0

Input	Description	Assignment
Signal evaluation	<ul> <li>Specify the signal of the connected encoder:</li> <li>Pulse/direction At the input count and direction signal are connected</li> <li>At the input there is an encoder connected with the following evaluation: <ul> <li>Rotary encoder single</li> <li>Rotary encoder double</li> <li>Rotary encoder quadruple</li> </ul> </li> </ul>	Pulse/direction
Hardware gate	<ul> <li>Gate control exclusively via channel 3:</li> <li>enabled: The gate control for channel 3 happens via SW and HW gate</li> <li>disabled: The gate control for channel 3 exclusively happens via SW gate</li> <li><i>Chap. 5.6.6.2 'Gate function' page 150</i></li> </ul>	disabled
Count direction inverted	<ul> <li>Invert the input signal <i>'Direction'</i>:</li> <li>enabled: The input signal is inverted</li> <li>disabled: The input signal is not inverted</li> </ul>	disabled

Output	Description	Assignment
Characteristics of the output	The output and the "Comparator" (STS_CMP) status bit are set, dependent on this parameter.	No comparison
	<ul> <li>No comparison: The output is used as normal output and STS_CMP remains reset.</li> <li>Comparator         <ul> <li>Counter value ≥ Comparison value</li> </ul> </li> </ul>	
	– Counter value $\leq$ Comparison value	
	<ul> <li>Pulse at comparison value</li> <li>To adapt the used actuators you can specify a pulse duration. The output is set for the specified pulse duration when the counter value reaches the comparison value. When you've set a main counting direction the output is only set at reaching the comparison value from the main counting direction.</li> </ul>	
Pulse duration	Here you can specify the <i>pulse duration</i> for the output signal.	0
	The pulse duration starts with the setting of the according digital output.	
	The inaccuracy of the <i>pulse duration</i> is less than 1ms.	
	There is no past triggering of the <i>pulse duration</i> when the <i>comparison value</i> has been left and reached again during pulse output.	
	If the <i>pulse duration</i> is changed during operation, it will take effect with the next pulse.	
	If the pulse duration = 0, the output is set until the com- parison condition is not longer fulfilled.	
	Range of values: 0510ms in steps of 2ms	

Frequency	Description		Assignment
Max. counting frequency		frequency for track A/pulse, Latch and HW gate	60kHz
	Frequency	shortest permissible count pulse	
	1kHz	400µs	
	2kHz	200µs	
	5kHz	80µs	
	10kHz	40µs	
	30kHz	13µs	
	60kHz	6.7µs	
	100kHz	4µs	

Deployment I/O periphery > Frequency measurement

Hardware interrupt	Description	Assignment
Hardware gate opening	Hardware interrupt by edge 0-1 exclusively at HW gate channel 3	disabled
	<ul> <li>enabled: Process interrupt by edge 0-1 exclusively at HW gate channel 3 with open SW gate</li> <li>disabled: no hardware interrupt</li> </ul>	
Hardware gate closing	Hardware interrupt by edge 1-0 exclusively at HW gate channel 3	disabled
	<ul> <li>enabled: Process interrupt by edge 1-0 exclusively at HW gate channel 3 with open SW gate</li> <li>disabled: no hardware interrupt</li> </ul>	
On reaching comparator	Hardware interrupt on reaching comparator	disabled
	<ul> <li>enabled: Hardware interrupt when comparator is trig- gered, can be configured via <i>'Characteristics of the</i> <i>output'</i></li> <li>disabled: no hardware interrupt</li> </ul>	
Overflow	Hardware interrupt overflow	disabled
	<ul> <li>enabled: Hardware interrupt on overflow the upper counter limit</li> <li>disabled: no hardware interrupt</li> </ul>	
Underflow	Hardware interrupt on underrun	disabled
	<ul> <li>enabled: Hardware interrupt on underflow the lower counter limit</li> <li>disabled: no hardware interrupt</li> </ul>

12.6.7.2.2 'Channel x'

**Operating mode** 

Select via 'Channel' the channel and select for pulse width modulation via 'Operating mode' the operating mode 'Pulse width modulation'. Default values and structure of this dialog box depend on the selected 'Operating mode'. The following parameters are supported:

Deployment I/O periphery > Pulse width modulation - PWM

- Period 1
- 2
- On-delay Pulse duration Pulse pause 3
- 4

#### Parameter overview

Operating parameters	Description	Assignment
Output format	<ul> <li>Here specify the range of values for the output. The CPU hereby determines the pulse duration:</li> <li>Per mil <ul> <li>Output value is within 0 1000</li> <li>Pulse duration = (Output value / 1000) x Period</li> </ul> </li> <li>S7 Analog value: <ul> <li>Output value is Siemens S7 analog value 0 27648</li> <li>Pulse duration = (Output value / 27648) x Period</li> </ul> </li> </ul>	Per mil
Time base	<ul> <li>Here you can set the time base, which will apply for resolution and range of values of the period duration, minimum pulse duration and on-delay.</li> <li>1ms: The time base is 1ms</li> <li>0.1ms: The time base is 0.1ms</li> <li>1µs: The time base is 1µs</li> </ul>	0.1ms
On-delay	Enter here a value for the time to expire from the start of the output sequence to the output of the pulse. The pulse sequence is output at the output channel, on expiration of the on-delay. Range of values: 0 65535 from this there are the fol- lowing effective values: Time base 1ms: 0 65535ms Time base 0.1ms: 0 65535ms Time base 1µs: 0 65535µs	0

Deployment I/O periphery > Pulse Train

Operating parameters	Description	Assignment
Period	With the period you define the length of the output sequence, which consists of pulse duration and pulse pause.	20000
	Range of values:	
	<ul> <li>Time base 1ms: 1 87ms</li> <li>Time base 0.1ms: 0.4 87.0ms</li> <li>Time base 1µs: 1 87µs</li> </ul>	
Minimum pulse duration	With the minimum pulse duration you can suppress short output pulses and short pulse pauses. All pulses or pauses, which are smaller than the minimum pulse dura- tion, are suppressed. This allows you to filter very short pulses (spikes), which can not be recognized by the periphery.	2
	Range of values:	
	<ul> <li>Time base 1ms: 0 Period / 2 · 1ms</li> <li>Time base 0.1ms: 2 Period / 2 · 0.1ms</li> <li>Time base 1µs: 0 Period / 2 · 1µs</li> </ul>

#### 12.9 SPEED7 Studio - Project transfer

#### Overview

There are the following possibilities for project transfer into the CPU:

#### Transfer via MPI

- Transfer via Ethernet
- Transfer via memory card

#### 12.9.1 Transfer via MPI

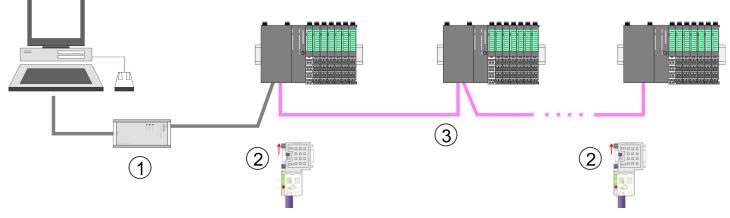

#### General

# Net structureThe structure of a MPI net is electrically identical with the structure of a PROFIBUS net.<br/>This means the same rules are valid and you use the same components for the build-up.<br/>The single participants are connected with each other via bus interface plugs and<br/>PROFIBUS cables. Per default the MPI net runs with 187.5kbaud. The CPUs are deliv-<br/>ered with MPI address 2.

SPEED7 Studio - Project transfer > Transfer via MPI

*MPI programming cable* The MPI programming cables are available at Yaskawa in different variants. The cables provide a RS232 res. USB plug for the PC and a bus enabled RS485 plug for the CPU. Due to the RS485 connection you may plug the MPI programming cables directly to an already plugged plug on the RS485 jack. Every bus participant identifies itself at the bus with an unique address, in the course of the address 0 is reserved for programming devices.

**Terminating resistor** A cable has to be terminated with its surge impedance. For this you switch on the terminating resistor at the first and the last participant of a network or a segment. Please make sure that the participants with the activated terminating resistors are always power supplied. Otherwise it may cause interferences on the bus.

- 1 MPI programming cable
- 2 Activate the terminating resistor via switch
- 3 MPI network

## Proceeding transfer via MPI

- **1.** Connect your PC to the MPI jack of your CPU via a MPI programming cable.
- 2. Switch-ON the power supply of your CPU and start the SPEED7 Studio with your project.
- 3. Set at 'Active PC interface' the "Serial interface".
- **4.** ▶ Click in the '*Project tree*' to your project and select '*Context menu* → *Recompile*'.
  - $\Rightarrow$  Your project will be translated and prepared for transmission.

SPEED7 Studio - Project transfer > Transfer via Ethernet

- **5.** ► To transfer the user program and hardware configuration click in the *Project tree* at your CPU and select *'Context menu* → *Transfer all'*.
  - ⇒ A dialog window for project transfer opens
- **6.** Select the 'Port type' "Serial interface" and start the transfer with 'Transfer'.
- 7. Confirm the request that the CPU is to be brought into the state STOP.
  - ⇒ The user program and the hardware configuration are transferred via MPI to the CPU.
- 8. Close after transmission the dialog.
- 9. With 'Context menu → Copy RAM to ROM' you can save your project on a memory card, if one is plugged.

#### 12.9.2 Transfer via Ethernet

**Proceeding transfer via Ethernet** For transfer via Ethernet the CPU has an Ethernet PG/OP channel. For online access to this, you have to assign IP address parameters to this by means of "initialization" and transfer them into your project. For the transfer, connect, if not already done, the Ethernet PG/OP channel jack to your Ethernet. The connection happens via an integrated 2-port switch (X1, X2).

- **1.** Switch-ON the power supply of your CPU and start the SPEED7 Studio with your project.
- 2. Set at 'Active PC interface' the "Ethernet interface".
- 3. Click in the 'Project tree' to your project and select 'Context menu -> Recompile'.
  - ⇒ Your project will be translated and prepared for transmission.

- **4.** ► To transfer the user program and hardware configuration click in the *Project tree* at your CPU and select *'Context menu* → *Transfer all'*.
  - ⇒ A dialog window for project transfer opens
- 5. Select the 'Port type' "Ethernet interface" and start the transfer with 'Transfer'.
- 6. Confirm the request that the CPU is to be brought into the state STOP.
  - ⇒ The user program and the hardware configuration are transferred via Ethernet to the CPU.
- 7. Close after transmission the dialog.
- 8. ► With 'Context menu → Copy RAM to ROM' you can save your project on a memory card, if one is plugged.

#### 12.9.3 Transfer via memory card

Proceeding transfer via<br/>memory cardThe memory card serves as external storage medium. There may be stored several proj-<br/>ects and sub-directories on a memory card. Please regard that your current project is<br/>stored in the root directory and has one of the following file names:

- S7PROG.WLD
- AUTOLOAD.WLD
- **1.** Start the SPEED7 Studio with your project.
- 2. Click in the 'Project tree' at the CPU.
- 3. Create in the SPEED7 Studio with 'Context menu
  - → Export device configuration (WLD)' a wld file.
  - ⇒ The wld file is created. This contains the user program and the hardware configuration

- **4.** Copy the wld file at a suited memory card. Plug this into your CPU and start it again.
  - ⇒ The transfer of the application program from the memory card into the CPU takes place depending on the file name after an overall reset or PowerON.

S7PROG.WLD is read from the memory card after overall reset.

AUTOLOAD.WLD is read from the memory card after PowerON.

The blinking of the SD LED of the CPU marks the active transfer. Please regard that your user memory serves for enough space for your user program, otherwise your user program is not completely loaded and the SF LED gets on.

### **13** Configuration with TIA Portal

#### 13.1 TIA Portal - Work environment

#### 13.1.1 General

#### General

In this chapter the project engineering of the CPU in the Siemens TIA Portal is shown. Here only the basic usage of the Siemens TIA Portal together with a CPU is shown. Please note that software changes can not always be considered and it may thus be deviations to the description. TIA means Totally integrated **A**utomation from Siemens. Here your PLCs may be configured and linked. For diagnostics online tools are available.

Information about the Siemens TIA Portal can be found in the online help respectively in the according online documentation.

#### Starting the TIA Portal

To start the Siemens TIA Portal with Windows select 'Start  $\rightarrow$  Programs  $\rightarrow$  Siemens Automation  $\rightarrow$  TIA ...'

Then the TIA Portal opens with the last settings used.

TIA		
Start	<ul> <li>Open existing project</li> <li>Create new project</li> </ul>	Existing projects: Project 1 Project 2
Online & Diagnostics	•	Project 3 
> Project view		

#### Exiting the TIA Portal

With the menu '*Project*  $\rightarrow$  *Exit*' in the '*Project view*' you may exit the TIA Portal. Here there is the possibility to save changes of your project before.

TIA Portal - Work environment > Work environment of the TIA Portal

#### 13.1.2 Work environment of the TIA Portal

Basically, the TIA Portal has the following 2 views. With the button on the left below you can switch between these views:

**Portal view** The *'Portal view'* provides a "task oriented" view of the tools for processing your project. Here you have direct access to the tools for a task. If necessary, a change to the Project view takes place automatically for the selected task.

**Project view** The '*Project view*' is a "structured" view to all constituent parts of your project.

Areas of the Project view The Project view is divided into the following areas:

ПА			
Menu			
	3		7
2	4	6	
	5		
8			

- 1 Menu bar with toolbars
- 2 Project tree with Details view
- 3 Project area 4 Device overv
  - Device overview of the project respectively area for block programming
- 5 Properties dialog of a device (parameter) respectively information area
- 6 Hardware catalog and tools
- 7 "Task-Cards" to select hardware catalog, tasks and libraries
- 8 Jump to Portal or Project view

TIA Portal - Hardware configuration - CPU

#### **13.2 TIA Portal - Functional limitations**

13.2 TIA Portal - Fu	
Limitation of performance data	Please note that the performance data of the CPU is limited to the performance data of the Siemens CPU used for the configuration.
No <i>'Upload device as new</i> station'	Due to the system <i>'Upload device as new station'</i> is currently not supported. Instead, use the <i>backup</i> and <i>restore</i> functions in the Siemens TIA Portal:
	<b>1.</b> ► To backup an online connected CPU, select 'Online → Backup from online device'.
	A backup object is created and stored in the project navigation at 'Online backups'. The backup contains all blocks of the project and the current device status.
	2. To restore into an online connected CPU it must be overall reset first. Then click in the project navigation under 'Online backups' on the created backup and select 'Context menu → Download to device'.
	$\Rightarrow$ The backup data is transferred online to the CPU.
No online blocks	Due to the system, online blocks of CPUs connected via 'Accessible devices' are cur- rently not listed.
13.3 TIA Portal - Ha	rdware configuration - CPU
Overview	The hardware configuration of the CPU and its plugged modules happens in the Siemens TIA Portal by means of a virtual PROFINET IO device. For the PROFINET interface is standardized software sided, the functionality is guaranteed by including a GSDML file into the Siemens TIA Portal.
	The hardware configuration of the CPU is divided into the following parts:
	Installation PROFINET IO device 'VIPA SLIO System'
	Configuration Siemens CPU
	Connection System SLIO CPU as PROFINET IO device
Installation PROFINET IO device <i>VIPA SLIO</i>	The installation of the PROFINET IO devices 'VIPA SLIO System' happens in the hard- ware catalog with the following approach:
System'	<b>1.</b> Go to the 'Download Center' of www.yaskawa.eu.com.
	<b>2.</b> Load under 'GSDML SLIO' the according file for your System SLIO.
	<b>3.</b> Extract the file into your working directory.
	<b>4.</b> Start the Siemens TIA Portal.
	5. Close all the projects.
	<b>6.</b> Switch to the <i>Project view</i> .
	7. ▶ Select 'Options → Install general station description file (GSD)'.
	<b>8.</b> Navigate to your working directory and install the according GSDML file.
	After the installation the hardware catalog is refreshed and the Siemens TIA Portal is finished.
	After restarting the Siemens TIA Portal the according PROFINET IO device can be found at 'Other field devices $\Rightarrow$ PROFINET $\Rightarrow$ IO $\Rightarrow$ VIPA $\Rightarrow$ SLIO System'.

TIA Portal - Hardware configuration - CPU

$\bigcirc$

*Thus, the components can be displayed, you have to deactivate the "Filter" of the hardware catalog.* 

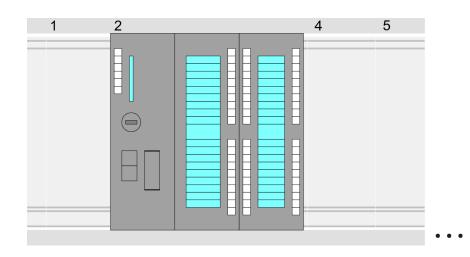

## Configuration Siemens CPU

With the Siemens TIA Portal, the System SLIO CPU is to be configured as CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3) from Siemens.

- **1.** Start the Siemens TIA Portal.
- 2. Create a new project in the Portal view with 'Create new project'.
- **3.** Switch to the *Project view*.
- **4.** Click in the *Project tree* at 'Add new device'.
- **5.** Select the following CPU in the input dialog:

SIMATIC S7-300 > CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3)

 $\Rightarrow$  The CPU is inserted with a profile rail.

#### **Device overview:**

Module	 Slot	 Туре	
PLC	2	CPU 314C-2 PN/DP

- 5. Select in the *Network view* the IO device '... SLIO CPU...' and switch to the Device overview.
  - ⇒ In the *Device overview* of the PROFINET IO device '... SLIO CPU' the CPU is already placed at slot 0. From slot 1 you can place your System SLIO modules.

Setting product specific CPU parameters of the CPU at slot 0 in the Device overview of the PROFINET IO device 'VIPA SLIO System'. Then the parameters of the CPU part are shown in the Properties dialog. Here you can make your parameter settings. Schap. 4.9 'Setting product specific CPU parameters' page 90 the Chap. 4.8.2 'Parameter CPU' page 86

#### 13.4 TIA Portal - Hardware configuration - Ethernet PG/OP channel

#### Overview

#### Please note!

- At the first commissioning respectively after a reset to factory setting the Ethernet interface has no IP address.
  - For online access, you have to assign valid IP address data to it by means of "Initialization".
- After initialization, you can transfer the IP address data to your project.

The CPU has an integrated Ethernet PG/OP channel. This channel allows you to program and remote control your CPU.

- The Ethernet PG/OP channel (X1/X2) is designed as switch. This enables PG/OP communication via the connections X1 and X2.
- Configurable connections are possible.
- DHCP respectively the assignment of the network configuration with a DHCP server is supported.

TIA Portal - Hardware configuration - Ethernet PG/OP channel > Take IP address parameters in project

Default diagnostics addresses: 2025 ... 2040 Via the Ethernet PG/OP channel, you have access to: Device website, where you can find information on firmware status, connected peripherals, current cycle times, etc. OPC UA project, which is to be created in the OPC UA Configurator. WebVisu project, which is to be created in the SPEED7 Studio. \_ PROFINET IO controller or the PROFINET I-Device. 1. Install your System SLIO with your CPU. Assembly and commissioning Wire the system by connecting cables for voltage supply and signals. 3. Connect the one of the Ethernet jacks (X1, X2) of the Ethernet PG/OP channel to Ethernet. **4.** Switch on the power supply. ⇒ After a short boot time the CP is ready for communication. He possibly has no IP address data and requires an initialization. "Initialization" The assignment of IP address data takes place via the MAC address. The IP address of your Ethernet PG/OP channel for the interfaces X1 and X2 can be found on the front of your CPU with the name "MAC PG/OP: ...". X1 PG/OP X2 PG/OP 

MAC PG/OP: 00-20-D5-77-05-10

#### 13.4.1 Take IP address parameters in project

2 variants for configuration From firmware version V2.4.0 and up, you have the following options for configuring the Ethernet PG/OP channel:

- Configuration via integrated CPU interface (firmware version V2.4.0 and up only).
- Configuration via additional CP (all firmware versions).

TIA Portal - Hardware configuration - Ethernet PG/OP channel > Take IP address parameters in project

13.4.1.1 Configuration via integrated CPU interface

Proceeding

From firmware version V2.4.0 this variant for configuration is recommended. The following advantages result:

- The configuration becomes clearer, because the periphery modules and the PROFINET IO devices are configured on the PROFINET line of the CPU and no additional CP is to be configured.
- There are no address collisions, because the S7 addresses for all components are assigned from the address area of the CPU.

Unless during the hardware configuration of the CPU  $\Leftrightarrow$  304 there was no IP address data assigned yet or these are to be changed, the configuration happens to the following proceeding, otherwise the Ethernet PG/OP channel is configured.

- **1.** Open the Siemens TIA Portal and, if not already done, configure the Siemens CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).
- 2. Click in the *Network view* at the PROFINET part of the Siemens CPU and enter the previous assigned IP address data and subnet in *'Properties'* at *'Ethernet address'* in the area *'IP protocol'*. The IP address data are not accepted without subnet assignment!
- **3.** Transfer your project.

#### 13.4.1.1.1 Time-of-day synchronization

**NTP** method

In the NTP mode (**N**etwork **T**ime **P**rotocol) the module sends as client time-of-day queries at regular intervals to all configured NTP servers within the sub net. You can define up to 4 NTP server. Based on the response from the servers, the most reliable and most exact time-of-day is determined. Here the time with the lowest *stratum* is used. *Stratum 0* is the time standard (atomic clock). *Stratum 1* are directly linked to this NTP server. Using the NTP method, clocks can be synchronized over subnet boundaries. The configuration of the NTP servers is carried out in the Siemens TIA Portal via the CP, which is already configured.

- **1.** In the 'Device configuration', click at 'PROFINET interface' of the Siemens CPU and open the 'Properties' dialog.
- 2. In the 'Properties', select 'Time-of-day synchronization'.
- **3.** Enable the NTP method.
- **4.** Add the appropriate NTP servers by specifying their IP addresses.
- **5.** Set the *'Update interval'* you want. Within this interval, the time of the module is synchronized once.
- **6.** Save and transfer your project to the CPU.
  - ⇒ After transmission, the NTP time is requested by each configured time server and the best response for the time synchronization is used.

Please note that although the time zone is evaluated, an automatic changeover from winter to summer time is not supported. Industrial systems with time-of-day synchronization should always be set in accordance to the winter time.

With the FC 61 you can determine the local time in the CPU. More information about the usage of this block may be found in the manual "SPEED7 Operation List". TIA Portal - Hardware configuration - Ethernet PG/OP channel > Take IP address parameters in project

#### 13.4.1.2 Configuration via additional CP

Proceeding

This is the conventional variant for configuration and is supported by all firmware versions. If possible, always use the configuration via the internal interface, otherwise the following disadvantages result:

- Address overlaps are not recognized in the Siemens TIA Portal.
- For PROFINET devices only the address range 0 ... 1023 is available.
- The addresses of the PROFINET devices are not checked with the address space of the CPU from the Siemens TIA portal for address overlaps.

The configuration happens according to the following procedure:

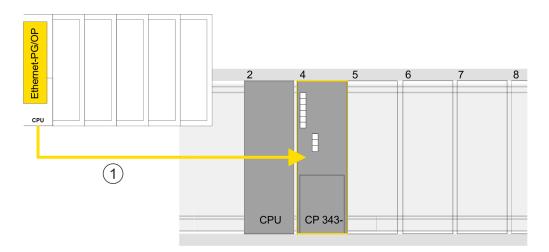

- **1.** Open your project.
- **2.** If not already done, configure in the *'Device configuration'* a Siemens CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3).
- **3.** As Ethernet PG/OP channel place at slot 4 the Siemens CP 343-1 (6GK7 343-1EX30 0XE0 V3.0).

#### CAUTION!

Please configure the diagnostic addresses of the CP343-1EX30 for 'PN-IO', 'Port1' and 'Port2' so that no overlaps occur in the periphery input area. Otherwise your CPU can not start-up and you receive the diagnostic entry 0xE904. Address overlaps are not recognized in the Siemens TIA Portal.

- **4.** Open the *'Property'* dialog by clicking on the CP 343-1EX30 and enter for the CP at *'Properties'* at *'Ethernet address'* the IP address data and subnet, which you have assigned before. The IP address data are not accepted without subnet assignment!
- 5. Transfer your project.

1 Ethernet PG/OP channel

#### **Device overview**

Module	 Slot	 Туре	
PLC	2	CPU 314C-2 PN/DP	
MPI/DP interface	2 X1	MPI/DP interface	

TIA Portal - Hardware configuration - I/O modules

PROFINET inter- face	2 X2	PROFINET interface
CP 343-1	4	CP 343-1

#### 13.4.1.2.1 Time-of-day synchronization

**NTP** method

In the NTP mode (**N**etwork **T**ime **P**rotocol) the module sends as client time-of-day queries at regular intervals to all configured NTP servers within the sub net. You can define up to 4 NTP server. Based on the response from the servers, the most reliable and most exact time-of-day is determined. Here the time with the lowest *stratum* is used. *Stratum 0* is the time standard (atomic clock). *Stratum 1* are directly linked to this NTP server. Using the NTP method, clocks can be synchronized over subnet boundaries. The configuration of the NTP servers is carried out in the Siemens TIA Portal via the CP, which is already configured.

- **1.** In the 'Device configuration', click the CP 343-1EX30.
- **2.** Click on '*PROFINET interface*' in the '*Device overview*'.
- 3. In the 'Properties', select 'Time-of-day synchronization'.
- **4.** Enable the NTP method by enabling 'Activate time-of-day synchronization' and selecting 'NTP' at 'Method'.
- **5.** Add the appropriate NTP servers by specifying their IP addresses.
- **6.** Select your *'Time zone'*. In the NTP method, UTC (**U**niversal **T**ime **C**oordinated) is generally transmitted; this corresponds to GMT (Greenwich Mean Time). By configuring the local time zone, you can set a time offset to UTC.
- **7.** Set the *'Update interval'* you want. Within this interval, the time of the module is synchronized once.
- 8. Save and transfer your project to the CPU.
  - After transmission, the NTP time is requested by each configured time server and the best response for the time synchronization is used.

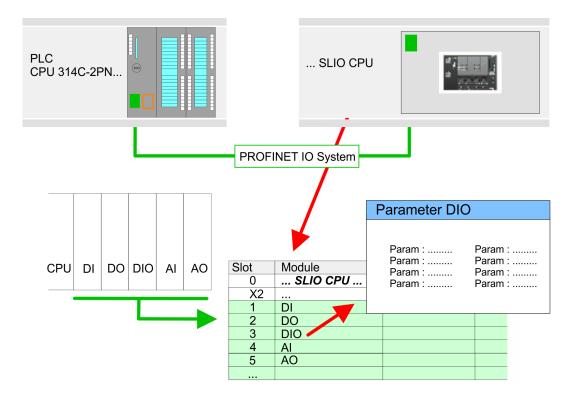

Please note that although the time zone is evaluated, an automatic changeover from winter to summer time is not supported. Industrial systems with time-of-day synchronization should always be set in accordance to the winter time.

With the FC 61 you can determine the local time in the CPU. More information about the usage of this block may be found in the manual "SPEED7 Operation List".

#### 13.5 TIA Portal - Hardware configuration - I/O modules

## Hardware configuration of the modules

Starting with slot 1 place in the *Device overview* of the PROFINET IO device '... SLIO CPU' your System SLIO modules in the plugged sequence. For this drag from the hardware catalog the corresponding module to the corresponding position in the *Device overview*.

## **Parameterization** To provide specific addressing of the installed peripheral modules, certain addresses must be allocated in the CPU. For parameterization click in the *Device overview* at the module you want to parameterize. Then the parameters of the module are shown in the *Properties* dialog. Here you can make your parameter settings.

#### 13.6 TIA Portal - Deployment PG/OP communication - PROFINET

 With firmware version V2.4.0, there is a PROFINET IO controller available via the Ethernet PG/OP channel.

 As soon as you use the PROFINET functionality via the Ethernet PG/OP channel, this affects the performance and response time of your system and due to the system the cycle time of the OB 1 is extended by 2ms.

#### 13.6.1 Deployment as PROFINET IO controller

#### 13.6.1.1 Steps of configuration

#### Range of functions

Please regard that the PROFINET IO controller supports only the PROFINET functions, which are described in this manual, even if the Siemens CPU, which is used for configuration, offers further functions! To use some described PROFINET functions, it is necessary to deploy another Siemens CPU for configuration. Here, however, is pointed to explicitly.

The configuration of the PROFINET IO controller for PROFINET communication should be done by the following procedure:

- **1.** Commissioning and Initialization (assignment IP address data)
- 2. Hardware configuration CPU
- 3. Configuration PROFINET IO controller
- 4. Configuration PROFINET IO device

With the Siemens TIA Portal, the Yaskawa CPU 013-CCF0R00 is to be configured as

CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3)!

13.6.1.2	Commissioning	and	initialization
----------	---------------	-----	----------------

Accomply and commis	1 Install your System SLIO with your CDL				
Assembly and commis- sioning	<b>1.</b> Install your System SLIO with your CPU.				
c.cg	2. Wire the system by connecting cables for voltage supply and signals				
	<ol> <li>Connect your PROFINET IO controller with Ethernet.</li> </ol>				
	<b>4.</b> Switch on the power supply.				
	$\Rightarrow$ After a short boot time, the CP is in idle.				
	At the first commissioning respectively after an overall reset of the CPU, the PROFINET IO controller and the Ethernet PG/OP channel have no IP address.				
Assign IP address param- eters	This function is supported only if the PROFINET IO controller is not yet configured. You get valid IP address parameters from your system administrator. The assignment of the IP address data happens online in the Siemens TIA Portal with the following proceeding:				
	1. Start the Siemens TIA Portal.				
	2. Switch to the 'Project view'.				
	<b>3.</b> Click in the <i>'Project tree'</i> at <i>'Online access'</i> and choose here by a doubleclick your network card, which is connected to the PROFINET interface.				
	4. To get the stations and their MAC address, use the 'Accessible device'. This can be found at the front of the CPU labelled as "MAC ETH:".				
	5. Choose from the list the module with the known MAC address and open with "Online & Diagnostics" the diagnostics dialog in the Project area.				
	6. Navigate to Functions > Assign IP address. Type in the IP configuration like IP address, subnet mask and gateway.				
	7. Confirm with [Assign IP configuration].				
	Directly after the assignment the PROFINET IO controller is online reachable using the set IP address data. The hardware configuration allows you to transfer the IP address data to your project. Schap. 13.3 'TIA Portal - Hardware confi- guration - CPU' page 304				

#### 13.6.1.3 Configuration PROFINET IO controller

#### 13.6.1.3.1 Proceeding

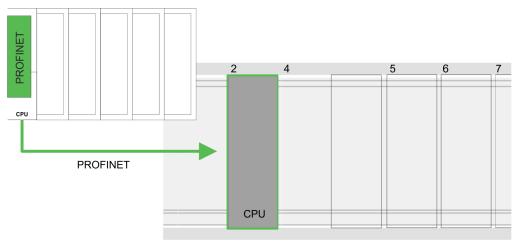

Precondition

To parametrize the PROFINET IO controller of the CPU, the following conditions must be fulfilled:

- The PROFINET IO controller is online reachable, this means an initialization was established.
- The hardware configuration described before was established and the PROFINET IO controller is networked.

#### Proceeding

- **1.** For parametrization click in the *Project area* at the CPU part.
- **2.** Click on 'PROFINET interface' in the Device overview.
  - ⇒ The parameters of the PROFINET interface are listed in the properties dialog.
- 3. Open the properties dialog of the PROFINET IO controller by a double-click at PN-IO.
  - The PROFINET interface of the PROFINET IO controller is parametrized with 'PROFINET interface\_...'.
  - With 'Port\_1' the port of the PROFINET interface of the PROFINET IO controller is parametrized.

#### **Device overview**

Module	 Slot	 Туре

General	<ul> <li>Name         <ul> <li>Here you can change the name of the port, which is also shown in the configuration table.</li> </ul> </li> <li>Comment         <ul> <li>Here you can describe the port in more detail. The comment also appears in the configuration table.</li> </ul> </li> </ul>
Port interconnection	These parameters serve for the port setting of the topology.
Port options	These parameters serve for the port setting. Here the following parameters are sup- ported:
	<ul> <li>Connection         <ul> <li>Here you can make settings for transmission medium and type. Ensure that the setting for the local port and the partner port are identical.</li> <li>PROFINET requires 100Mbps in duplex mode.</li> </ul> </li> </ul>

Please regard that at activated 'Autonegotiation' the communication with a communication partner that has fixed transmission parameters always happens in 'Full-duplex' mode!

#### Boundaries

Boundaries are limitations for the transfer of certain Ethernet frames. The following Boundaries are supported:

*'End of detection of accessible nodes'*: DCP frames for detecting accessible nodes are not forwarded. When enabled, participants which are lying behind this port, are no longer recognized and can not be reached by the controller. *'End of topology discovery'*: When activated, this port does not support topology detection, i.e. the LLDP telegrams are not forwarded.

**Diagnostic addresses** 

- Start address
  - The CPU reports errors of the IO controller via the 'Start address', as soon as e.g. an error during synchronization of the IO controller occurs. This address is also used to identify the IO system to which the device belongs, if an IO device fails.

#### 13.6.1.4 Configuration PROFINET IO device

#### Precondition

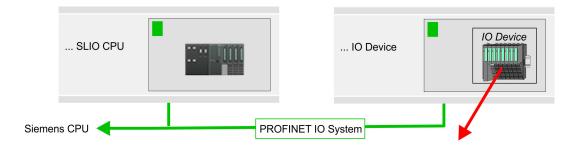

- The modules, which may be configured here are listed in the hardware catalog.
- For the deployment of the PROFINET IO devices you have to include the modules into the hardware catalog by means of the product specific GSDML file.
- After the installation of the GSDML file the PROFINET IO devices may be found in the hardware catalog at 'Other field devices → PROFINET → IO → VIPA ...
   → ... SLIO System'.

Thus, the components can be shown, you have to deactivate the "Filter" of the hardware catalog.

**Configure IO devices** Now the project engineering of the PROFINET IO controller is finished. Please link up now your IO devices with periphery to your IO controller.

- **1.** For the project engineering of the PROFINET IO device you search the concerning PROFINET IO device in the hardware catalog at *PROFINET-IO* and drag&drop it in the subnet of your IO controller.
- **2.** Assign a name to the IO device. The configured name must match the name of the device. Information about setting the device name can be found in the manual of the IO device.
- **3.** Enter a valid IP address. The IP address is normally assigned automatically by the hardware configurator. If this is not desired, you can assign the IP address manually.
- **4.** Link up the modules of your IO device in the plugged sequence and add the addresses that should be used by the modules.
- **5.** If needed, parametrize the modules.
- **6.** Save, compile and transfer your project. Save, compile and transfer your project. *transfer' page 328*

#### **Device overview**

	 2	 	

#### 13.6.2 Deployment as PROFINET I-Device

13.6.2.1 Steps of configuration

#### Functionality

#### Range of functions

Please regard that the PROFINET IO controller supports only the PROFINET functions, which are described in this manual, even if the Siemens CPU, which is used for configuration, offers further functions! To use some described PROFINET functions, it is necessary to deploy another Siemens CPU for configuration. Here, however, is pointed to explicitly.

The *I-Device* (Intelligent IO device) functionality of a CPU allows data to be exchanged with an IO controller, which are preprocessed by the CPU. In this case, the I-Device is connected as an IO device to a higher-level IO controller. The process values, recorded in central or decentralized periphery, can be preprocessed via a user program and made available to the higher-level PROFINET IO controller by means of PROFINET.

- The configuration of the integrated PROFINET IO controller of the CPU as an I-Device is made via a virtual PROFINET devices, which is to be installed by means of a product specific GSDML in the hardware catalog.
- The communication takes place via input/output areas, which are defined in the I-Device.
- The size of the areas for input and output data is max. 768byte.
- The I-Device is made available to a deterministic PROFINET IO system via a PROFINET IO interface and thus supports the real-time communication Real-Time.
- The I-Device functionality meets the requirements of the RT class I (A) and corresponds to the PROFINET specification version V 2.3.
- The configuration of a PROFINET CPU as an IO controller and at the same time as an I-Device is possible. The influence of the I-Device configuration on the system limits or performance of the PROFINET controller is equated with that of a device. This means that when the IO controller and I-Device are used at the same time on the PROFINET controller, the I-Device is to be regarded as an additional device for determining the system limits.
- In order for the higher-level IO controller to communicate with the I-Device, the following must be observed:
  - The device name of the PROFINET controller of the I-Device must match the device name of the I-Device at the higher-level IO controller.
  - When using the Siemens SIMATIC Manager or the TIA Portal, in order to avoid name conflicts, I-Device and IO controller must be configured in different logical networks.

The PROFINET IO controller supports a maximum IO block size of 512 bytes (consistent).

**Configuration** The configuration of the PROFINET IO controller as I-Device should be done by the following procedure:

- **1.** Installation of the GSDML files
- **2.** Configuration as I-Device
- 3. Configuration in the higher-level IO controller

Transfer I-Device from<br/>SPEED7 StudioIf the configuration of the *I-Device* from the SPEED7 Studio is to be applied to the IO con-<br/>troller of a third-party system, then you must export from the SPEED7 Studio the<br/>according GSDLM file and import it into the IO controller of the third-party system.

- **1.** Start the SPEED7 Studio with your PROFINET project.
- Click at the CPU in 'Devices and networking' and select 'Context menu
   → Create GSDML file'. Specify an 'Export path' and an unique 'Device name'.
  - ⇒ The GSDML file is created and exported. Import this GSDML file into your thirdparty system.

nfiguration of the PROFINET IO controller as I-Device should be done by the fol

#### 13.6.2.2 Installation of the GSDML files

The following GSDML files are required for configuring the integrated PROFINET IO controller of the CPU as I-Device:

- GSDML for I-Device
- GSDML for I-Device at IO controller

**Proceeding** The installation of the PROFINET IO device '*SLIO CPU*' happens in the hardware catalog with the following approach:

- **1.** Go to the 'Download Center' of www.yaskawa.eu.com.
- **2.** Load under 'GSDML SLIO' the according file for your System SLIO.
- 3. Extract the file into your working directory.
- **4.** Start the Siemens TIA Portal.
- **5.** Close all the projects.
- 6. Switch to the *Project view*.
- 7. ▶ Select 'Options → Install general station description file (GSD)'.
- **8.** Navigate to your working directory and install the according GSDML file.
  - After the installation the hardware catalog is refreshed and the Siemens TIA Portal is closed.

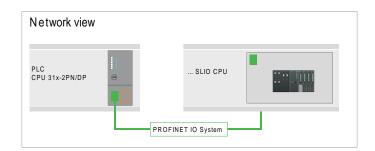

After restarting the Siemens TIA Portal following virtual devices can be found in the Hardware catalog at '*PROFINET IO*  $\rightarrow$  Other field devices  $\rightarrow$  VIPA ...  $\rightarrow$  ... SLIO System  $\rightarrow$  SLIO I-Device':

- PN I-Device for CPU
  - This allows you to configure the Input/output areas in the I-Device of the CPU.
- PN I-Device config 013-CCF0R00 for higher-level CPU
  - This allows you to connect the I-Device CPU to the higher-level IO controller.

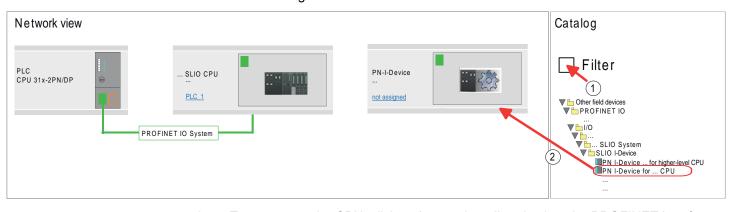

Thus, the components can be shown, you have to deactivate the "Filter" of the hardware catalog.

#### 13.6.2.3 Configuration as I-Device

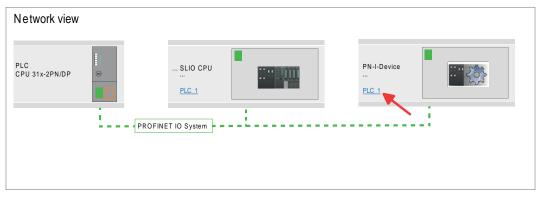

It is assumed that a hardware configuration of the CPU exists. Schap. 13.3 'TIA Portal - Hardware configuration - CPU' page 304

After installing the GSDML the 'PN I-Device for ... CPU' can be found in the hardware catalog at 'Other field devices → PROFINET IO → I/O → VIPA ...
 → ... SLIO System → SLIO I-Device'. Drag 'PN I-Device for ... CPU' from the hardware catalog to Network view.

**2.** To connect to the CPU, click at *'not assigned'* and select the PROFINET interface of the CPU.

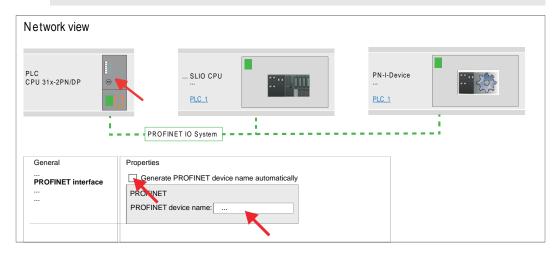

Network view		
PLC CPU 31x-2PN/DP	SLIO CPU	PN-I-Device
	FINET IO System	

 $\Rightarrow$  The properties dialog of the CPU is opened.

**4.** Under '*Properties*', click at '*PROFINET interface* ... ' and navigate to '*PROFINET*'. Disable '*Generate PROFINET device name automatically*' and enter a name for the I-Device at '*PROFINET device name*'.

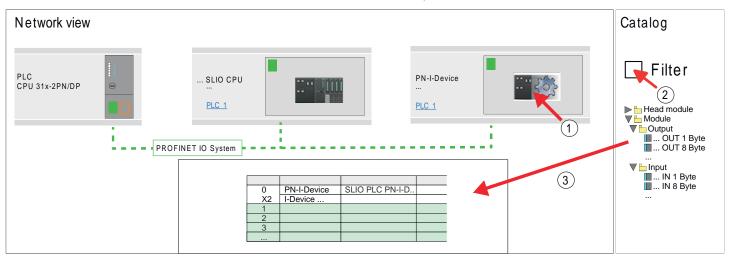

5. Click in the *Network view* at the PN I-Device and switch to the *Device overview*.

- 6. Activate the 'Filter' in the hardware catalog.
- **7.** Create the transfer areas by dragging them to the 'Slots' as I/O areas from the hardware catalog to the *Device view*. There must be no gaps in the slots. To create the transfer areas, the following input and output areas are available that can be assigned to the virtual I-Device:
  - Input: 1, 8, 16, 32, 64, 128, 256, 512 byte
  - Output: 1, 8, 16, 32, 64, 128, 256, 512 byte

The data direction for Input or Output refers to the view of the I-Device.

- Input areas define data that are sent from the higher-level IO controller to the I-Device and which are mapped to the input address area of the CPU.
- Output areas define data that are sent to the higher-level IO controller and which are to stored in the output address area of the CPU.

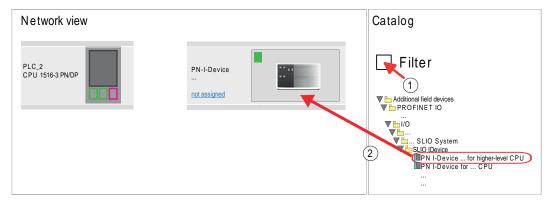

8. Save and transfer your project to the CPU.

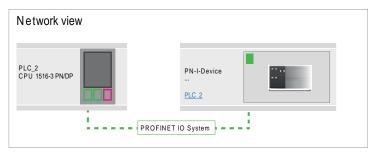

#### 13.6.2.4 Configuration in the higher-level IO controller

It is assumed that a CPU with the higher-level IO controller, such as a Siemens CPU 1516-3 PN/DP with IP address is configured. The IP address must be in the same IP circuit as the IP address of the I-Device.

- 1. Den the project of the CPU with the higher-level IO controller.
- 2. For the project engineering of I-Device in the higher-level IO controller you have to search the device 'PN I-Device 013-CCF0R00 for higher-level CPU' in the hard-ware catalog at PROFINET-IO and drag&drop it in the Network view.

3. To connect to the CPU, click at *'not assigned'* and select the PROFINET interface of the CPU.

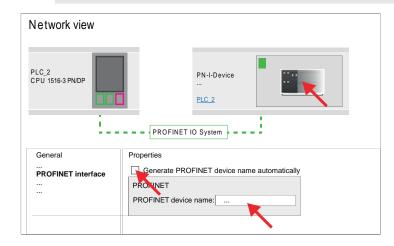

**4.** ▶ Click at '*PN-I-Device*' and select '*Context menu* → *Properties*'.

Network view	
PLC_2 CPU 1516-3 PN/DP	PN-I-Device
i{	PROFINET IO System

 $\Rightarrow$  The properties dialog of the CPU is opened.

**5.** Under 'Properties', click at 'PROFINET interface ... ' and navigate to 'PROFINET'. Disable 'Generate PROFINET device name automatically' and enter at 'PROFINET device name' the previously noted name of the I-Device.

- **7.** Configure an input area of the same size for each output area of the I-Device in the IO controller and vice versa. Here also no gaps may arise. In particular, make sure that the order of the transfer areas matches that of the I-Device configuration. The following transfer units are available:
  - Input: 1, 8, 16, 32, 64, 128, 256, 512 byte per slot
  - Output: 1, 8, 16, 32, 64, 128, 256, 512 byte per slot

- 8. Save and transfer your project to the CPU.
  - Your PROFINET CPU is now connected as an I-Device to the higher-level PROFINET IO controller.

TIA Portal - Option: Deployment PROFIBUS communication > Deployment as PROFIBUS DP master

$\bigcirc$	
	,
	- <b> </b>
	1

#### I-Device with S7 routing

S7 routing is not possible with the procedure above. S7 routing is only possible if the I-Device and the higher-level I/O controller are configured in the same network. The device names must not be identical. By using identical names and extending the name of the I-Device with "-x", this is detected internally and used appropriately for S7 routing.

- 13.7 TIA Portal Option: Deployment PROFIBUS communication
- 13.7.1 Fast introduction

**Overview** 

The PROFIBUS DP master must be configured in the *Project view*. Here the configuration happens by the sub module X1 (MPI/DP) of the Siemens CPU.

#### Enable bus functionality via VSC

To switch the interface X3 MPI(PtP) to PROFIBUS functionality you have to activate the according bus functionality by means of a Yaskawa VSC storage media. By plugging the VSC storage card and then an overall reset the according functionality is activated. Chap. 4.16 'Deployment storage media - VSD, VSC' page 119

**Steps of configuration** The configuration of the PROFIBUS DP master should be done with the following approach:

- Activating bus functionality by means of a VSC
- Hardware configuration CPU
- Deployment as DP master *or* deployment as DP slave
- Transfer of the entire project to the CPU

#### 13.7.2 Activating bus functionality by means of a VSC

Proceeding

To use the MPI(PtP) interface X3 as PROFIBUS interface, the PROFIBUS functionality must be activated by means of a YaskawaVSC memory card.

- 1. Plug the Yaskawa VSC memory card. & Overview' page 119
- 2. Execute an overall reset. S Chap. 4.13 'Overall reset' page 113
  - ⇒ The PROFIBUS functionality is enabled.
    - With activating the bus functionality "PROFIBUS DP master", the bus functionality "PROFIBUS DP slave" is also enabled.

#### 13.7.3 Hardware configuration - CPU

Perform a hardware configuration for the CPU. Schap. 13.3 'TIA Portal - Hardware configuration - CPU' page 304

#### 13.7.4 Deployment as PROFIBUS DP master

Precondition The hardware configuration described before was performed.

TIA Portal - Option: Deployment PROFIBUS communication > Deployment as PROFIBUS DP master

#### Proceeding

- **1.** Switch to the 'Device view'.
- 2. Select the PROFIBUS interface of your CPU 314C-2 PN/DP (314-6EH04-0AB0 V3.3) and select 'Context menu → Properties'.
  - $\Rightarrow$  The *'Properties'* dialog is shown.
- 3. On the 'General' tab, click 'MPI Address'.
  - $\Rightarrow$  The dialog for the MPI address appears.
- **4.** Set the *'Interface type'* to "PROFIBUS".
- 5. Connect to PROFIBUS and preset an address (preferably 2).
- 6. Switch at 'Operating mode' to "DP master".
  - $\Rightarrow$  A master system is inserted.

#### **5.** Save, compile and transfer your project.

# 13.7.5 Deployment as PROFIBUS DP slave

### **Fast introduction**

The following section describes how to use the PROFIBUS part as an "intelligent" DP slave on master systems. Execute the following steps:

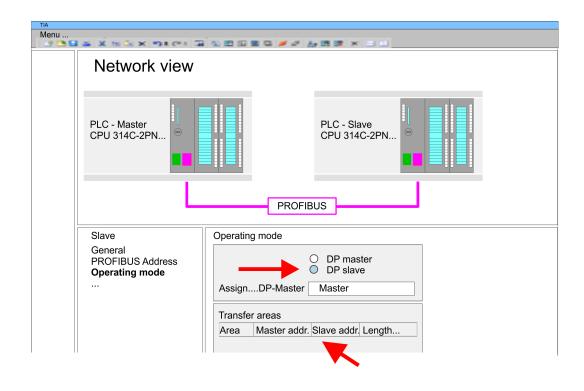

- **1.** Configure a station with a CPU with DP master mode.
- 2. Network with PROFIBUS
- **3.** Configure another station with a CPU with DP slave operating mode.
- **4.** Network with PROFIBUS and assign the DP slave to the DP master.
- **5.** Configure the I/O areas for the slave part.
  - $\Rightarrow$  The configuration is automatically adapted to the DP master.
- **6.** Save, translate and transfer the respective project into the corresponding master or slave CPU.

Configuration of the master part

- 1. Start the Siemens TIA Portal and configure a CPU.
- 2. Designate the station as "... DP master".
- **3.** Integrate the modules according to the hardware configuration of the master system.
- **4.** Select the PROFIBUS interface of the master CPU and select '*Context menu* → *Properties*'.
  - ⇒ The 'Properties' dialog is shown.
- 5. Set at interface: Type "PROFIBUS".
- 6. Connect to PROFIBUS and preset an address (e.g. 2).
- 7. Switch at Operating mode to "DP master".

#### 

- **3.** Integrate your modules according to your hardware configuration.
- **4.** Select the PROFIBUS interface of your CPU and select '*Context menu* → *Properties*'.
  - ⇒ The 'Properties' dialog is shown.
- 5. Set at interface: Type "PROFIBUS".
- 6. Connect to PROFIBUS and preset an address (e.g. 3).
- 7. Switch at 'Operating mode' to "DP slave".
- 8. Under 'Assigned DP master', select your master system.
- **9.** Use *'Transfer area'* to define the I/O address areas of the slave CPU that are to be assigned to the DP slave.
- **10.** Save, translate and transfer the respective project into the corresponding master or slave CPU.

# 13.8 Deployment OPC UA

🖏 Chap. 7 'Deployment OPC UA' page 191

TIA Portal - Project transfer

# **13.9 TIA Portal - Include Controls Library**

The product specific blocks can be found at www.yaskawa.eu.com in the 'Download Center' under 'Controls Library' as library download file.

- The library is available as packed zip file for the corresponding TIA Portal version.
- As soon as you want to use product specific blocks you have to import them into your project.

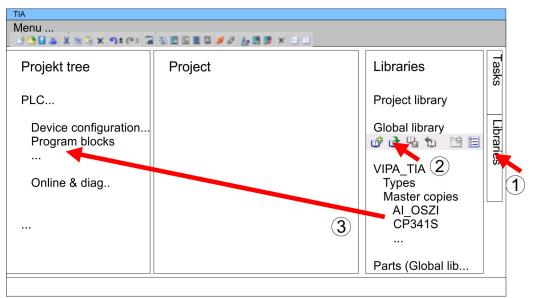

Execute the following steps:

- Load an unzip the file ...TIA\_Vxx.zip (note TIA Portal version)
- Open library and transfer blocks into the project

**Unzip ...TIA\_Vxx.zip** Start your un-zip application with a double click on the file TIA\_Vxx.zip and copy all the files and folders in a work directory for the Siemens TIA Portal.

Open library and transfer blocks into the project

- **1.** Start the Siemens TIA Portal with your project.
- 2. Switch to the Project view.
- 3. Choose "Libraries" from the task cards on the right side.
- 4. Click at "Global libraries".
- 5. Click at "Open global libraries".
- 6. Navigate to your directory and load the file ... TIA.alxx.

**7.** Copy the necessary blocks from the library into the "Program blocks" of the *Project tree* of your project. Now you have access to the product specific blocks via your user application.

# 13.10 TIA Portal - Project transfer

### Overview

There are the following possibilities for project transfer into the CPU:

- Transfer via MPI
- Transfer via Ethernet
- Transfer via memory card

### 13.10.1 Transfer via MPI

Transfer via MPI

Currently the programming cables from Yaskawa for transfer via MPI are not supported. This is only possible with the programming cable from Siemens.

- **1.** Establish a connection to the CPU via MPI with an appropriate programming cable. Information may be found in the corresponding documentation of the programming cable.
- **2.** Switch-ON the power supply of your CPU and start the Siemens TIA Portal with your project.
- 3. Select in the *Project tree* your CPU and choose 'Context menu → Download to device → Hardware configuration' to transfer the hardware configuration.
- 4. To transfer the PLC program choose 'Context menu → Download to device
   → Software'. Due to the system you have to transfer hardware configuration and PLC program separately.

# 13.10.2 Transfer via Ethernet

For transfer via Ethernet the CPU has the following interface:

■ X1/X2: Ethernet PG/OP channel

*Initialization* So that you may the according Ethernet interface, you have to assign IP address parameters by means of the "initialization". So *Chap. 13.4 'TIA Portal - Hardware configuration - Ethernet PG/OP channel' page 307* 

Please consider to use the same IP address data in your project for the CP 343-1.

Transfer

- **1.** For the transfer, connect, if not already done, the appropriate Ethernet jack to your Ethernet.
  - **2.** Open your project with the Siemens TIA Portal.
  - **3.** Click in the *Project tree* at *Online access* and choose here by a double-click your network card, which is connected to the Ethernet PG/OP interface.
  - 4. Select in the *Project tree* your CPU and click at [Go online].
  - 5. Set the access path by selecting "PN/IE" as type of interface, your network card and the according subnet. Then a net scan is established and the corresponding station is listed.
  - 6. Establish with [Connect] a connection.
  - 7. ▶ Click to 'Online → Download to device'.
    - ⇒ The according block is compiled and by a request transferred to the target device. Provided that no new hardware configuration is transferred to the CPU, the entered Ethernet connection is permanently stored in the project as transfer channel.

TIA Portal - Project transfer > Transfer via memory card

# 13.10.3 Transfer via memory card

Proceeding

The memory card serves as external storage medium. There may be stored several projects and sub-directories on a memory card. Please regard that your current project is stored in the root directory and has one of the following file names:

- S7PROG.WLD
- AUTOLOAD.WLD
- **1.** Start the Siemens TIA Portal with your project.
- **2.** Create a wild file with '*Project*  $\rightarrow$  *Memory card file*  $\rightarrow$  *New*'.
  - ⇒ The wld file is shown in the *Project tree* at "SIMATIC Card Reader" as "Memory card file".
- 3. Copy the blocks from the *Program blocks* to the wld file. Here the hardware configuration data are automatically copied to the wld file as "System data".
- **4.** Copy the wld file at a suited memory card. Plug this into your CPU and start it again.
  - ⇒ The transfer of the application program from the memory card into the CPU takes place depending on the file name after an overall reset or PowerON.

S7PROG.WLD is read from the memory card after overall reset.

AUTOLOAD.WLD is read from the memory card after PowerON.

The blinking of the SD LED of the CPU marks the active transfer. Please regard that your user memory serves for enough space for your user program, otherwise your user program is not completely loaded and the SF LED gets on.

		20: MGT: PG command causes the restart of the component

Event ID	Description
	21: MGT: Take-over of component data basis causes the hot restart of the component
	23: Stopping the sub-system after having loaded the already existing consistency-secured SDBs xxxx by the rack component
	25: The SIMATIC procedure has been selected for the time synchronisation of the component.
	26: Component actively established a connection
	28: The SDB xxxx loaded by the rack component is the consistency securing object (SDB type 0x3118)
	29: The component actively disconnected the system connection to the CPU
	31: Inconsistency of the component data base by loading SDB xxxx by the rack component (SDB type 0x3100)
	32: Periphery enabled by S7-CPU
	33: Periphery disabled by S7-CPU
	34: Component STOP due to switch actuation
	35: Component STOP due to invalid configuration
	36: Component STOP due to PG command
	38: SDB xxxx is not registered in the still valid consistency securing object, or it has an incorrect time stamp (SDB type 0x3107), the error is being corrected
	40: Memory reset executed
	44: Consistency of the data base achieved after loading the SDBs xxxx by the rack component (SDB type xxxx)
	45: Remanent part of the component data base is deleted by the rack component after being loaded
	70: Restore factory defaults (same as memory reset of CPU!)
	83: Network interface: automatic configuration, TP/ITP with 10 Mbit/s semi-duplex
	96: The MAC address was retrieved from the system SDB. This is the configured address.
	97: The MAC address was retrieved from the boot EPROM. This is the factory-provided address.
	100: Restart of the component
	101: Component STOP due to deletion of system SDBs
	104: PG command start was denied due to missing or inconsistent configuration
	105: Component STOP due to double IP address
	107: Start-up request by switch actuation was denied due to missing or inconsistent configuration
	PK: NCM_SERVICE
	2: Management
	3: Object management system
	6: Time synchronisation
	10: IP_CONFIG
	38: SEND/RECEIVE
